

Ultra-Small, Hex Voltage, Microprocessor Supervisor

MAX16055

General Description

The MAX16055 precision hex voltage microprocessor (μ P) supervisory circuit monitors up to six system-supply voltages and asserts a single reset when any one supply voltage drops below its preset threshold. The device significantly reduces system size and component count while improving reliability compared to multiple ICs or discrete components.

A variety of factory-trimmed threshold voltages are available to accommodate different supply voltages and tolerance with minimal external components. The MAX16055 includes internally fixed threshold options for monitoring 3.3V, 3.0V, 2.5V, 1.8V, 1.5V, 1.2V, 1.1V, 1.0V, and 0.9V supplies with -5% or -10% tolerance. The MAX16055 is also available with one to five adjustable threshold inputs to monitor voltages down to 0.5V.

A single active-low, open-drain output asserts when any monitored input falls below its associated threshold. The reset output features a weak internal pullup (typically 70 μ A) to supply input IN1. The reset output remains low for the reset timeout period (140ms, min) after all voltages rise above the selected thresholds. The reset output remains valid as long as either IN1 or IN2 input voltage is above 1V. The MAX16055 is available in a small 10-pin μ MAX[®] (3mm x 3mm) package. The MAX16055 operates over the -40°C to +125°C automotive temperature range.

Applications

Telecommunications	Networking Equipment
High-End Printers	Industrial Equipment
Desktop and Notebook Computers	Set-Top Boxes
	Servers/Workstations
Data Storage Equipment	

μ MAX is a registered trademark of Maxim Integrated Products, Inc.

Pin Configuration

Features

- ◆ Precision Factory-Set Reset Threshold Options 3.3V, 3.0V, 2.5V, 1.8V, 1.5V, 1.2V, 1.1V, 1.0V, and 0.9V
- ◆ Adjustable Voltage Threshold Monitors Down to 0.5V with 1.5% Accuracy
- ◆ Open-Drain $\overline{\text{RESET}}$ Output with 70 μ A Internal Pullup
- ◆ Fixed 140ms (min) Reset Timeout Period
- ◆ Manual Reset Input
- ◆ Reset Valid for IN1 \geq 1V or IN2 \geq 1V
- ◆ Tolerance Select (5%/10%) Input
- ◆ Immune to Short Supply Transients

Typical Operating Circuit

Ultra-Small, Hex Voltage, Microprocessor Supervisor

ABSOLUTE MAXIMUM RATINGS

RESET, TOL, MR, IN₋ to GND-0.3V to +6V
 Input/Output Current (all pins)20mA
 Continuous Power Dissipation (T_A = +70°C)
 10-Pin µMAX (derate 5.6mW/°C above +70°C)444mW

Operating Temperature Range-40°C to +125°C
 Storage Temperature Range-65°C to +150°C
 Junction Temperature+150°C
 Lead Temperature (soldering, 10s)+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{IN1} = 1V to 5.5V, T_A = -40°C to +125°C, unless otherwise noted. Typical values are at V_{IN1} = 3.3V, T_A = +25°C.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNIT
Operating Voltage Range	V _{IN1}	(Note 2)		1.0		5.5	V
Input Current (Note 3)	I _{IN-}	V _{IN-} = nominal input voltage (for IN2–IN6; 3.3V, 3.0V, 2.5V, 1.8V, 1.5V, 1.2V, 1.1V, 1.0V, 0.9V supplies)			25	40	µA

Pin Description

PIN	NAME	FUNCTION
1	IN1	Voltage Input 1. IN1 is the power-supply input and voltage monitoring input for the device. Connect a 0.1 μ F bypass capacitor from IN1 to GND. Keep IN1 or IN2 > 1V to ensure \overline{RESET} is valid.
2	IN2	Voltage Input 2. See the <i>Selector Guide</i> for voltage threshold. Keep IN1 or IN2 > 1V to ensure \overline{RESET} is valid.
3	IN3	Voltage Input 3. See the <i>Selector Guide</i> for voltage threshold.
4	IN4	Voltage Input 4. See the <i>Selector Guide</i> for voltage threshold.
5	IN5	Voltage Input 5. See the <i>Selector Guide</i> for voltage threshold.
6	IN6	Voltage Input 6. See the <i>Selector Guide</i> for voltage threshold.
7	TOL	Threshold Tolerance Input. Connect TOL to GND to select thresholds 5% below nominal. Connect TOL to IN1 to select thresholds 10% below nominal.
8	\overline{MR}	Active-Low Manual-Reset Input. When \overline{MR} is low, \overline{RESET} goes low and remains asserted for the reset timeout period after \overline{MR} is pulled high. \overline{MR} is internally pulled high by a 20k Ω pullup resistor to IN1.
9	\overline{RESET}	Active-Low Reset Output. \overline{RESET} goes low when any input (IN_) goes below the specified threshold. After all inputs rise above the specified threshold voltages, \overline{RESET} remains low for 140ms (min) before going high. The open-drain \overline{RESET} output features a weak (70 μ A) internal pullup to IN1.
10	GND	Ground

Ultra-Small, Hex Voltage, Microprocessor Supervisor

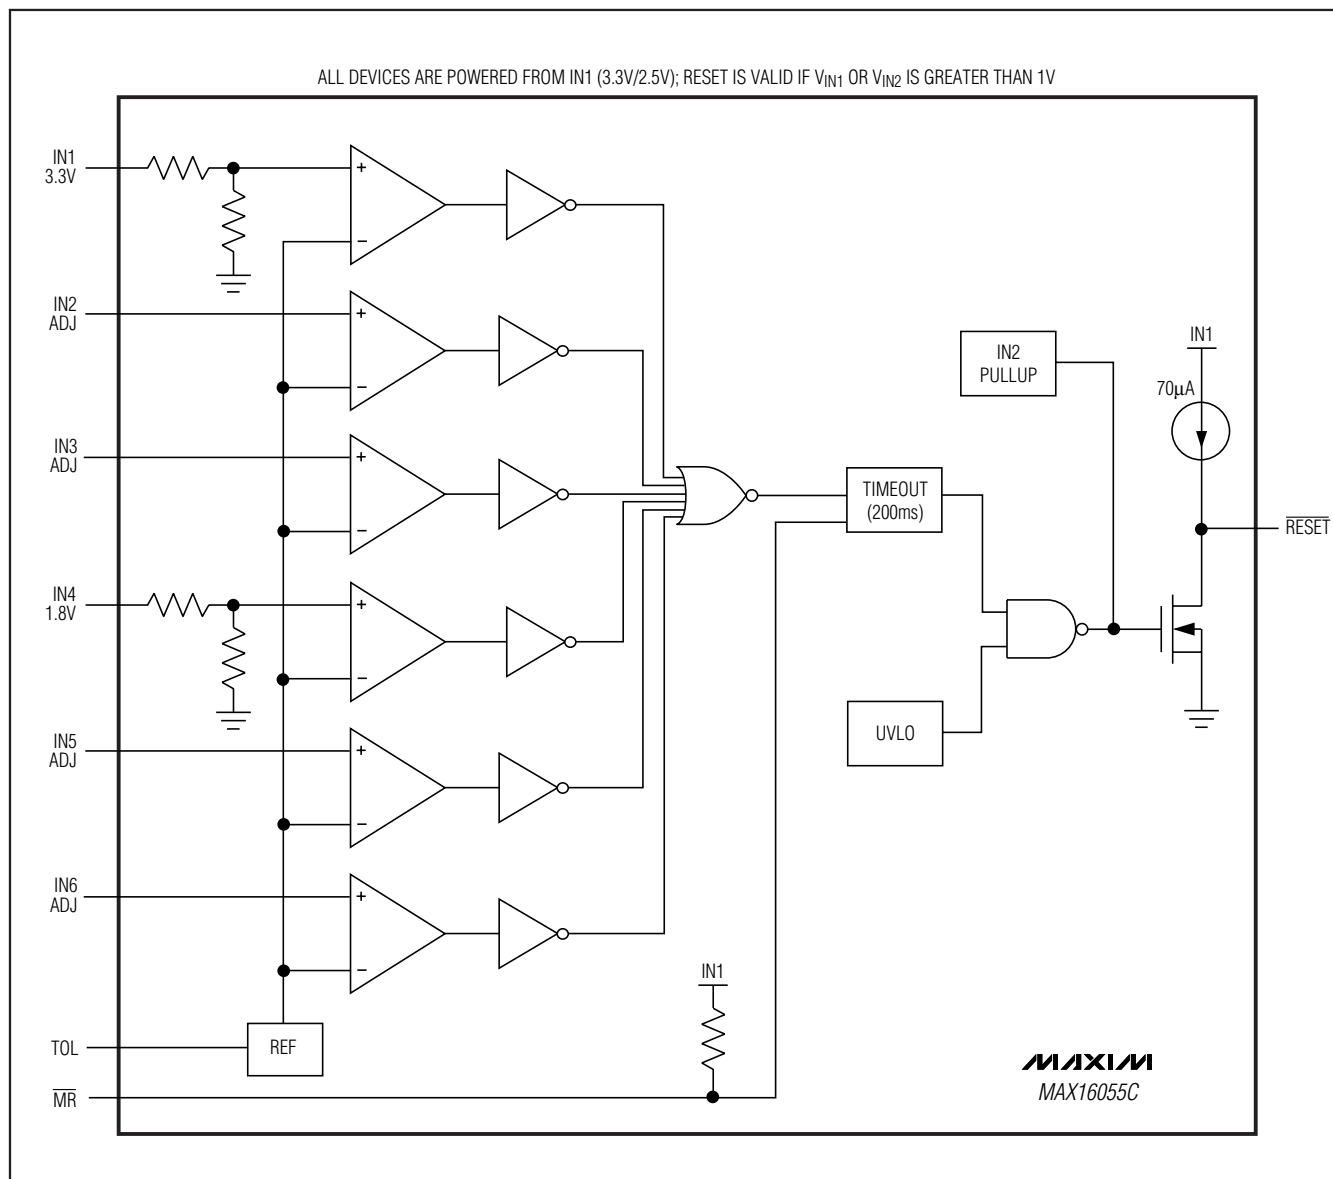

Figure 1. Functional Diagram

Detailed Description

The MAX16055 hex voltage μ P supervisory circuit maintains system integrity in multisupply systems (Figure 1). The MAX16055 offers accurate, factory-fixed undervoltage threshold options for monitoring very low voltages. The MAX16055 also offers one to five adjustable thresholds for monitoring voltages down to 0.5V. See the *Selector Guide* for the available threshold options.

The MAX16055 includes an accurate voltage reference, precision comparators, and a series of accurate internal resistor-divider networks to set the factory-fixed reset threshold options for monitoring 3.3V, 3.0V, 2.5V, 1.8V, 1.5V, 1.2V, 1.1V, 1.0V, or 0.9V supplies. The resistor networks scale the specified IN_+ threshold voltages to match the internal reference voltage. Adjustable threshold options allow the monitored voltage to be connected to the input of the internal comparator. Use an external voltage-divider to set the threshold voltage.

Ultra-Small, Hex Voltage, Microprocessor Supervisor

The MAX16055 is immune to short $IN_$ transients. Each of the internal comparators provides a typical hysteresis of 0.3% with respect to the reset threshold. This built-in hysteresis improves the monitor's immunity to ambient noise without significantly reducing threshold accuracy. See the *Typical Operating Characteristics* for a glitch immunity graph labeled Maximum $IN_$ Transient Duration vs. Reset Threshold Overdrive.

Reset Output

The MAX16055 \overline{RESET} output asserts low when any monitored $IN_$ voltage drops below the specified reset threshold. \overline{RESET} remains low for the reset timeout period of 140ms (min) after all inputs rise above the respective thresholds (Figure 2). The \overline{RESET} output is open drain with a weak internal pullup to the monitored $IN1$ supply (70 μ A typ). For many applications, no external pullup resistor is required to interface with other logic devices. Apply an external pullup resistor to any voltage from 0 to 5.5V when interfacing to different logic-supply voltages (Figure 3). Internal circuitry prevents reverse current flow from the external pullup voltage into the \overline{RESET} output when \overline{RESET} is not asserted. \overline{RESET} asserts low upon power-up. After all $IN_$ inputs rise above the respective threshold voltages, \overline{RESET}

remains low for the reset timeout period (Figure 4) before going high.

$IN1$ powers the MAX16055 and is also a monitored voltage. When any monitored supply drops below the threshold voltage, \overline{RESET} asserts low and remains low while either $IN1$ or $IN2$ is above 1.0V.

Adjustable Thresholds

The MAX16055 includes monitor options with adjustable reset thresholds. The threshold voltage at each adjustable $IN_$ input is typically 0.5V. To monitor a voltage higher than 0.5V, connect a resistor-divider network to the circuit as shown in Figure 5:

$$V_{INTH} = 0.5V \times (R1 + R2)/R2$$

Therefore:

$$R1 = R2 ((V_{INTH}/0.5V) - 1)$$

Use high valued resistors ($\sim 100k\Omega$) to minimize current through the external resistors. Use lower valued resistors for greater accuracy. The MAX16055 includes an internal voltage clamp (1.5V typ) at each of the adjustable voltage inputs. An input voltage higher than 1.5V induces a higher input current.

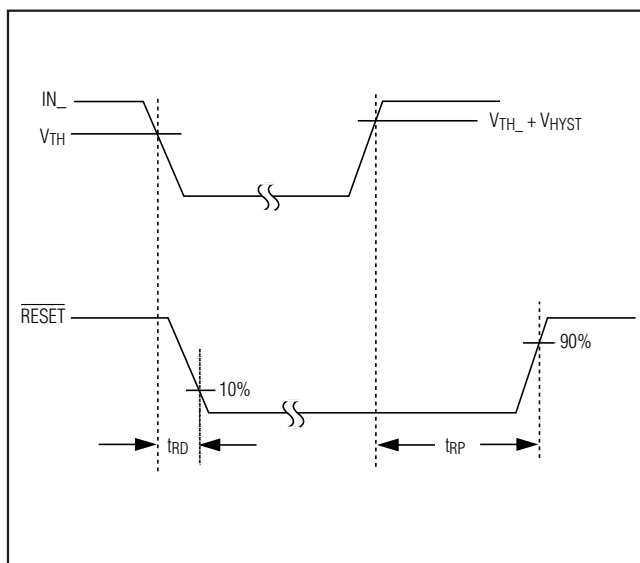

Figure 2. \overline{RESET} Output Timing Diagram

Figure 3. Interfacing with External Logic-Supply Voltage

Ultra-Small, Hex Voltage, Microprocessor Supervisor

Figure 4. $\overline{\text{RESET}}$ Output with Various Input Voltages

Manual-Reset Input ($\overline{\text{MR}}$)

Many μP -based products require manual-reset capability. A logic-low on $\overline{\text{MR}}$ asserts $\overline{\text{RESET}}$ low. $\overline{\text{RESET}}$ remains asserted while $\overline{\text{MR}}$ is low, and during the reset timeout period (140ms, min) after $\overline{\text{MR}}$ returns high. The $\overline{\text{MR}}$ input has an internal 20k Ω pullup resistor to IN1. Connect a normally open momentary switch from $\overline{\text{MR}}$ to GND to create a manual-reset function. Connect a 0.1 μF capacitor from $\overline{\text{MR}}$ to GND to provide additional noise immunity when driving $\overline{\text{MR}}$ from long cables or when the device is used in a noisy environment.

Tolerance (TOL)

The MAX16055 features an adjustable threshold tolerance. Connect TOL to GND to set the threshold voltages 5% below the nominal value. Connect TOL to IN1 to set the threshold voltages 10% below the nominal value. See the *Electrical Characteristics* table. Do not leave TOL unconnected.

Figure 5. Setting the Adjustable Threshold

Applications Information

Unused Inputs

Connect unused monitor inputs to a supply voltage higher than the specified threshold voltage. Connect a 100k Ω resistor between an unused adjustable input and IN1 to limit the bias current. Use IN1 for normal operation (device power supply). Do not connect unused monitor inputs to ground. Do not leave unused monitor inputs unconnected.

Reset Output Pullup Resistor

When connecting a pullup resistor from $\overline{\text{RESET}}$ to a voltage rail lower than the voltage on IN1, the internal 70 μA pullup current flows through the pullup resistor, causing the voltage at $\overline{\text{RESET}}$ to be higher than the voltage rail when $\overline{\text{RESET}}$ is deasserted. Ensure that the value of the pullup resistor is low enough that the voltage rise does not cause problems.

Power-Supply Bypassing and Grounding

IN1 powers the MAX16055. Connect a 0.1 μF bypass capacitor from IN1 to ground. All monitored inputs are immune to short supply transients. Add bypass capacitors from IN2–IN6 to GND to improve noise immunity.
