3:1 Active Switch for HDMI™ Signals with Optimized Equalization for Enhanced Signal Integrity

Features

- Supply voltage, V_{DD} = 3.3V ±5%
- Each of the three input ports can support HDMI™ or DVI signals
- Supports both AC-coupled and DC-coupled inputs
- Supports DeepColor™
- High Performance, up to 2.5 Gbps per channel
- Switching support for 3 side band signals (SCL, SDA and HPD)
- 5V Tolerance on all side band signals
- SCL, SDA, and HPD pins are the only pins that can support HOT INSERTION
- Integrated 50-ohm (±10%) termination resistors at each high speed signal input
- TMDS input termination control on all high speed inputs
- HDCP reset circuitry for quick communication when switching from one port to another
- Configurable output swing control
- Configurable Pre-Emphasis levels
- Configurable De-Emphasis
- Optimized Equalization

  Single default setting will support all cable lengths
- 8kV Contact ESD protection on all input data/clock channels per IEC61000-4-2
- Propagation delay ≤ 2ns
- High Impedance Outputs when disabled
- Packaging (Pb-free & Green):
  - 80-pin LQFP (FF80)
  - 64-pin TQFN (ZL64)

Description

Pericom Semiconductor's PI3HDMI301 3:1 active switch circuit is targeted for high-resolution video networks that are based on DVI/HDMI™ standards and TMDS signal processing. The PI3HDMI301 is an active 3 TMDS to 1 TMDS receiver switch with Hi-Z outputs. The device receives differential signals from selected video components and drives the video display unit. It provides controllable output swings, as well as provides a unique advanced pre-emphasis technique to increase rise and fall times which are reduced during transmission across long distances.

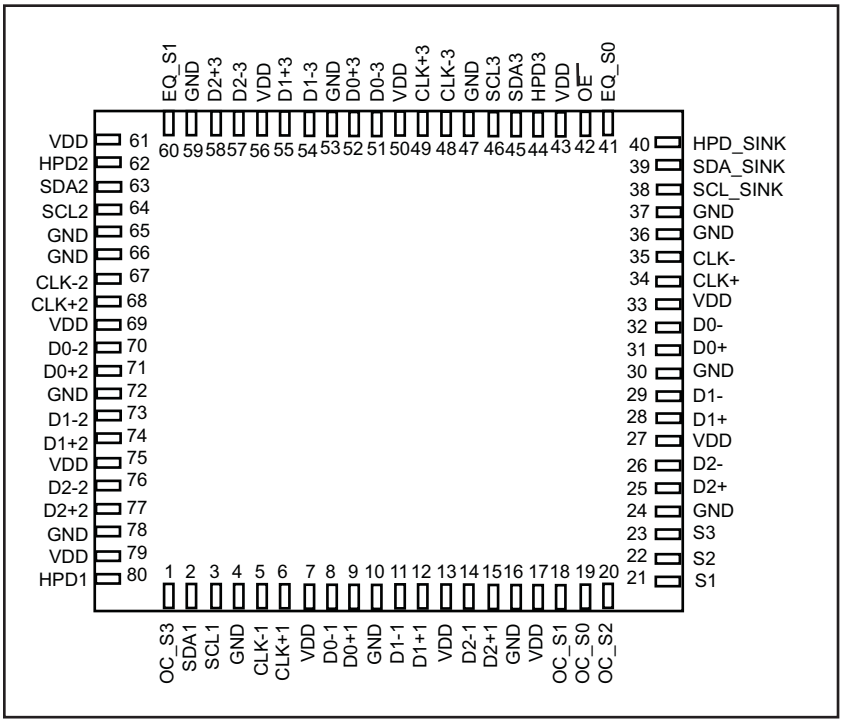
Each complete HDMI/DVI channel also has slower speed, side band signals, that are required to be switched. Pericom's solution provides a complete solution by integrating the side band switch together with the high speed switch in a single solution. Using Equalization at the input of each of the high speed channels, Pericom can successfully eliminate deterministic jitter caused by long cables from the source to the sink. The elimination of the deterministic jitter allows the user to use much longer cables (up to 25 meters).

The maximum DVI/HDMI Bandwidth of 2.5 Gbps provides 36-bit Deep Color™ support, which is offered by HDMI™ revision 1.3. Due to its active uni-directional feature, this switch is designed for usage only for the video receiver's side. For consumer video networks, the device sits at the receiver's side to switch between multiple video components, such as PC, DVD, STB, D-VHS, etc. The PI3HDMI301 also provides enhanced robust ESD/EOS protection of 8kV, which is required by many consumer video networks today.

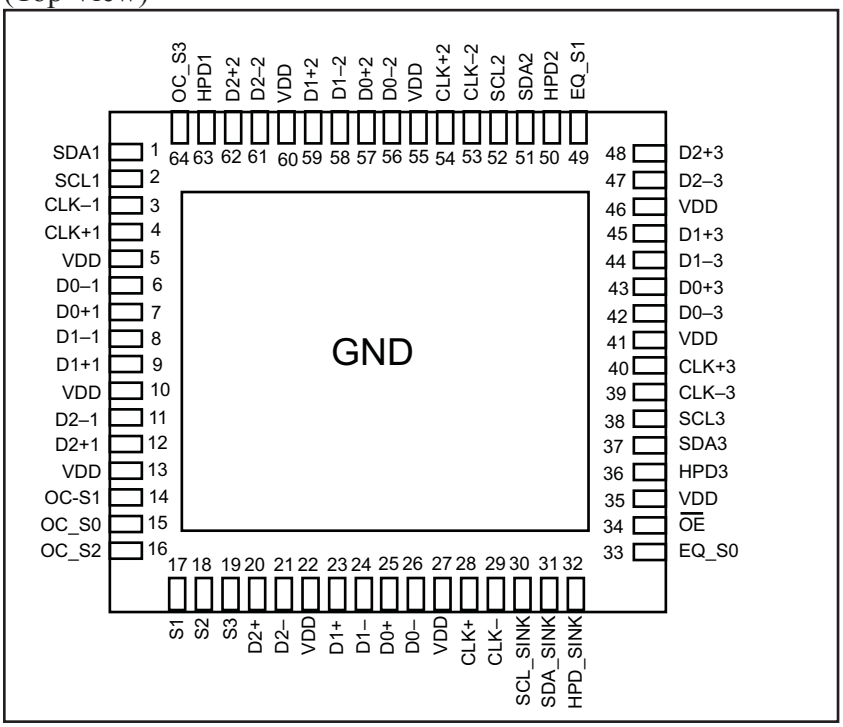
The Optimized Equalization provides the user a single optimal setting that can provide passing results for HDMI jitter tests for all cable lengths: 1meter to 20meters with DeepColor support up to 36bits.

Pericom also offers the ability to fine tune the equalization settings in situations where cable length is known. For example, if 25meter cable length is required, Pericom's solution can be adjusted to 16dB EQ to accept 25meter cable length.

Pin Configuration (Top View)

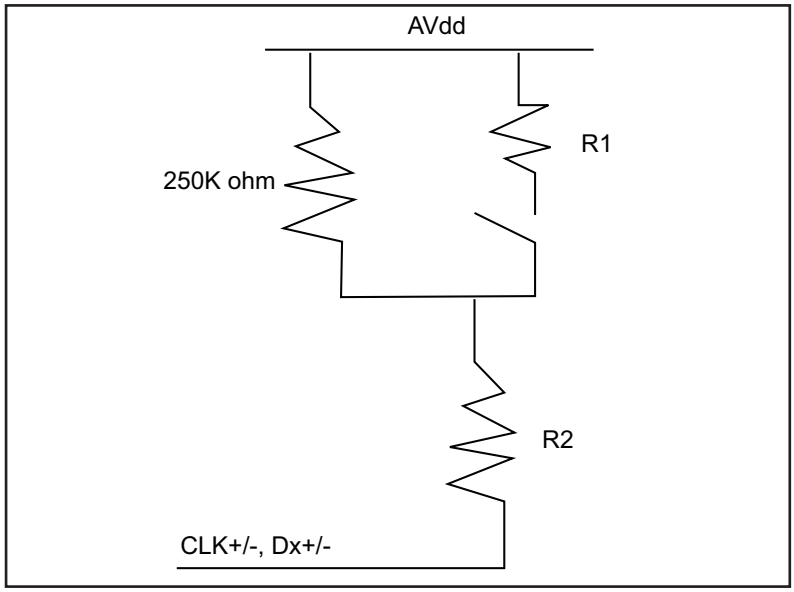


(Top View)



Receiver Block[1]

Each input has integrated equalization that can eliminate deterministic jitter caused by 25meter 24AWG cables. All activity can be configured using pin strapping. The Rx block is designed to receive all relevant signals directly from the HDMI™ connector without any additional circuitry, 3 High speed TMDS data, 1 pixel clock, 1 HPD signals, and DDC signals. TMDS Channels have following termination scheme for Rx Sense support.



Note:
1. $R_1 + R_2 = 50\ \Omega$

Pin Description

80 LQFP Pin #	64 TQFN Pin #	Pin Name	I/O	Description
9, 12, 15, 6	7, 9,12, 4	D_0+1, D_1+1, D_2+1, CLK+1	I	Port 1 TMDS Positive inputs

EQ Setting Value Logic Table for high speed data bits (TMDS CLK input is left at 3dB default always)

EQ_S1(1)	EQ_S0(1)	Setting Value
0	0	15dB on all high speed data inputs
0	1	3dB on all high speed data inputs
1	0	8dB on all high speed data inputs
1	1	Optimized Equalization on all high speed data inputs (Default setting which can support all cable lengths from 1meter to 20meters)

Notes:

1) Integrated internal pull-ups

Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... –65°C to +150°C
Supply Voltage to Ground Potential..... –0.5V to +4.0V
DC Input Voltage ..... –0.5V to V_{DD}
DC Output Current..... 120mA
Power Dissipation 1.0W

Note:
Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended Operating Conditions

$t_{pd(DDC)}$	Propagation delay from SCLn to SCL_SINK or SDAx to SDA_SINK or SDA_SINK to SDAx	C_L = 10pF		0.4	2.5	ns
Control and Status Pins (OC_SX, EQ_SX, Sx, HPD_SINK, HPDx)						
$t_{pd(HPD)}$	Propagation delay (from HPD_SINK to the active port of HPDx)	C_L = 10pF		2	6.0	ns
$t_{sx(HPD)}$	Switch time (from port select to the latest valid status of HPDx)			3	6.5	

Notes:

1. All typical values are at 25°C and with a 3.3V supply.
2. $t_{sk(o)}$ is the magnitude of the difference in propagation delay times between any specified terminals of channel 2 to 4 of a device when inputs are tied together.

Application Information

Supply Voltage

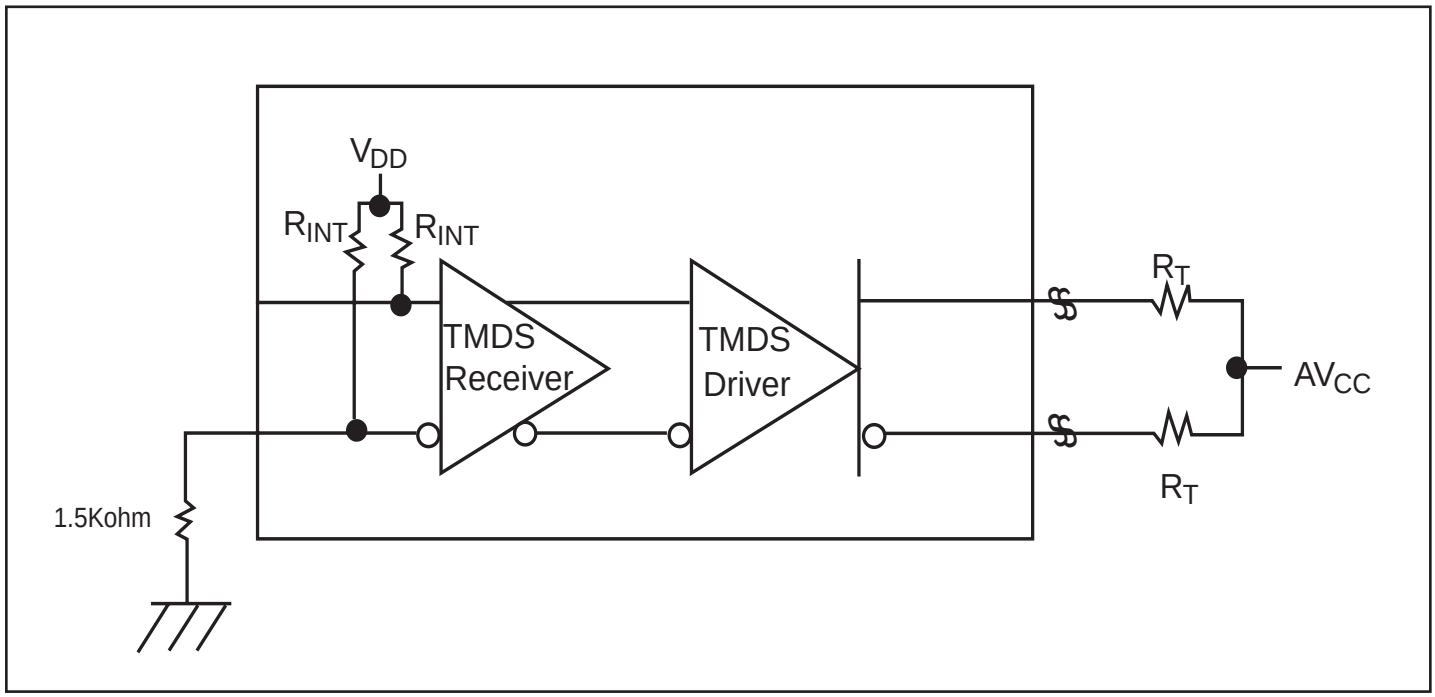
All V_{DD} pins are recommended to have a 0.01µF capacitor tied from V_{DD} to GND to filter supply noise

TMDS inputs

Standard TMDS terminations have already been integrated into Pericom's PI3HDMI301 device. Therefore, external terminations are not required. Any unused port must be left floating and not tied to GND.

TMDS output oscillation elimination

The TMDS inputs do not incorporate a squelch circuit. Therefore, we reccomend the input to be externally biased to prevent output oscillation. One pin will be pulled high to V_{DD} with the other grounded through a 1.5K-Ohm resistor as shown.



TMDS Input Fail-Safe Recommendation

Recommended Power Supply Decoupling Circuit

Figure 1 is the recommended power supply decoupling circuit configuration. It is recommended to put 0.1µF decoupling capacitors on each V_{DD} pins of our part, there are four 0.1µF decoupling capacitors are put in Figure 1 with an assumption of only four V_{DD} pins on our part, if there is more or less V_{DD} pins on our Pericom parts, the number of 0.1µF decoupling capacitors should be adjusted according to the actual number of V_{DD} pins. On top of 0.1µF decoupling capacitors on each V_{DD} pins, it is recommended to put a 10µF decoupling capacitor near our part's V_{DD}, it is for stabilizing the power supply for our part. Ferrite bead is also recommended for isolating the power supply for our part and other power supplies in other parts of the circuit. But, it is optional and depends on the power supply conditions of other circuits.

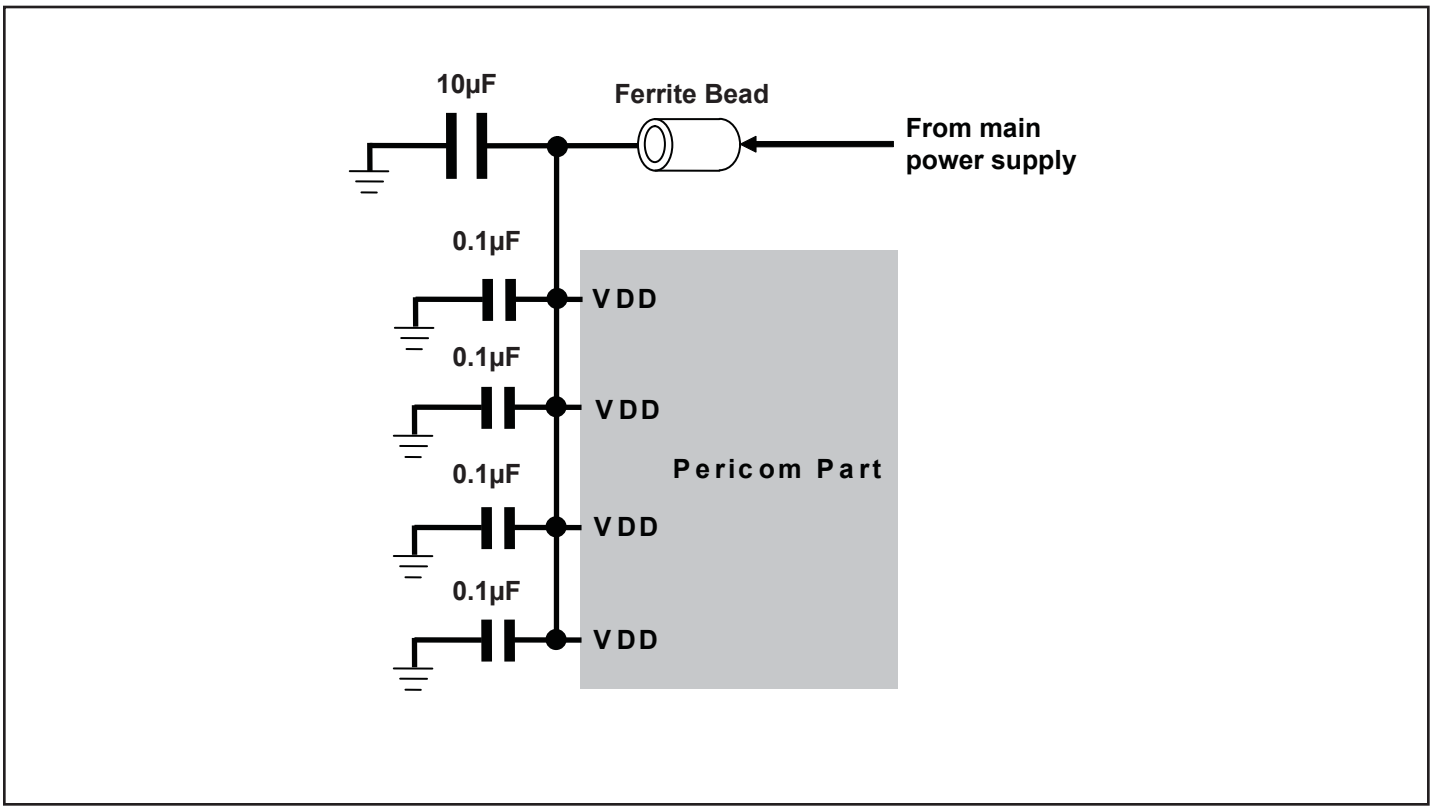


Figure 1 Recommended Power Supply Decoupling Circuit Diagram

Requirements on the Decoupling Capacitors

There is no special requirement on the material of the capacitors. Ceramic capacitors are generally being used with typically materials of X5R or X7R.

Layout and Decoupling CapacitorPlacement Consideration

i. Each 0.1µF decoupling capacitor should be placed as close as possible to each V_{DD} pin.
ii. V_{DD} and GND planes should be used to provide a low impedance path for power and ground.
iii. Via holes should be placed to connect to V_{DD} and GND planes directly.
iv. Trace should be as wide as possible
v. Trace should be as short as possible.
vi. The placement of decoupling capacitor and the way of routing trace should consider the power flowing criteria.
vii. 10µF capacitor should also be placed closed to our part and should be placed in the middle location of 0.1µF capacitors.
viii. Avoid the large current circuit placed close to our part; especially when it is shared the same V_{DD} and GND planes. Since large current flowing on our V_{DD} or GND planes will generate a potential variation on the V_{DD} or GND of our part.

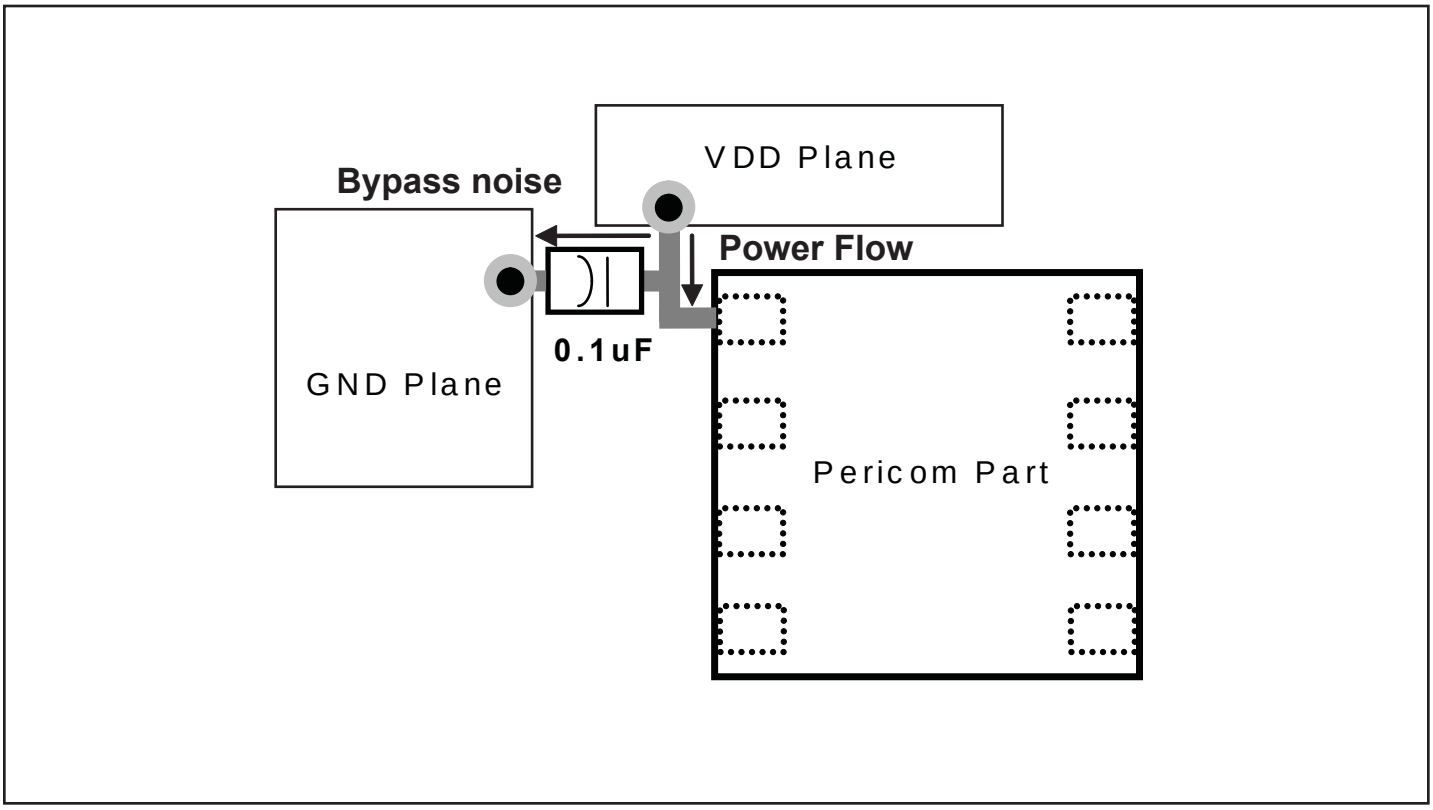

Figure 2 Layout and Decoupling Capacitor Placement Diagram
