

The CY91520 series is a Cypress 32-bit microcontroller designed for automotive devices. This series contains the FR81S CPU which is compatible with the FR family.

**Note:** This series is a composition of the end of the above-mentioned each name of articles of presence, According to Presence of sub-clock, CSV initial value and LVD initial value. Please see "Ordering Information" for details.

## Features

### FR81S CPU Core

- 32-bit RISC, load/store architecture, pipeline 5-stage structure
- Maximum operating frequency: 80 MHz (Source oscillation = 4.0 MHz and 20 multiplied (PLL clock multiplication system))
- General-purpose register : 32 bits × 16 sets
- 16-bit fixed length instructions (basic instruction), 1 instruction per cycle
- Instructions appropriate to embedded applications
  - Memory-to-memory transfer instruction
  - Bit processing instruction
  - Barrel shift order etc.
- High-level language support instructions
- Function entry/exit instructions
- Register content multi-load and store instructions
- Bit search instructions
  - Logical 1 detection, 0 detection, and change-point detection
- Branch instructions with delay slot
- Overhead reduction during branch process
- Register interlock function
- Easy assembler writing
- The support at the built-in / instruction level of the multiplier
- Signed 32-bit multiplication: 5 cycles
- Signed 16-bit multiplication: 3 cycles
- Interrupt (PC/PS saving)
  - 6 cycles (16 priority levels)
- The Harvard architecture allows simultaneous execution of program and data access.
- Instruction compatibility with the FR Family
- Built-in memory protection function (MPU)
  - Eight protection areas can be specified commonly for instructions and the data.
  - Control access privilege in both privilege mode and user mode.
- Built-in FPU (floating point arithmetic)
  - IEEE754 compliant
  - Floating-point register 32-bit × 16 sets

### Peripheral Functions

- Clock generation (equipped with SSCG function)
  - Main oscillation (4 MHz to 16 MHz)
  - Sub oscillation (32 kHz) or none sub oscillation
  - PLL multiplication rate : 1 to 20 times
  - Equipped with a 100 kHz CR oscillator
- Built-in program flash memory capacity
  - CY91F522: 256 + 64 KB
  - CY91F523: 384 + 64 KB
  - CY91F524: 512 + 64 KB
  - CY91F525: 768 + 64 KB
  - CY91F526: 1024 + 64 KB
- Flash memory for built-in data (WorkFlash) 64 KB
- Built-in RAM capacity
  - Main RAM
    - CY91F522: 48 KB
    - CY91F523: 48 KB
    - CY91F524: 64 KB
    - CY91F525: 96 KB
    - CY91F526: 128 KB
  - Backup RAM 8 KB
- General-purpose ports:
  - CY91F52xB 44 sets (No sub oscillation), 42 sets (sub oscillation)
  - CY91F52xD 56 sets (No sub oscillation), 54 sets (sub oscillation)
  - CY91F52xF 76 sets (No sub oscillation), 74 sets (sub oscillation)
  - CY91F52xJ 96 sets (No sub oscillation), 94 sets (sub oscillation)
  - CY91F52xK 120 sets (No sub oscillation), 118 sets (sub oscillation)
  - CY91F52xL 152 sets (No sub oscillation), 150 sets (sub oscillation)
  - Included I<sup>2</sup>C open drain corresponding ports: 16 sets
- External bus interface
  - 22-bit address, 16-bit data
- DMA Controller
  - Up to 16 channels can be started simultaneously.
  - 2 transfer factors (Internal peripheral request and software)
- A/D converter (successive approximation type)
  - 12-bit resolution : Max. 48 ch (32 ch + 16 ch)
  - Conversion time : 1.4 μs

- D/A converter (R-2R type)
  - 8-bit resolution : 2 ch
- External interrupt input: 8 channels × 2 units total 16 channels
  - Level ("H" / "L"), or edge detection (rising or falling) enabled
- Multi-function serial communication (built-in transmission/reception FIFO memory) : Max.12 channels
  - 5 V tolerant input: 4 channels ch.6, ch.8, ch.9, ch.11 CMOS hysteresis input < UART (Asynchronous serial interface) >
  - Full-duplex double buffering system, 64-step transmission FIFO memory, 64-step reception FIFO memory
  - Parity or no parity is selectable.
  - Built-in dedicated baud rate generator
  - An external clock can be used as the transfer clock
  - Parity, frame, and overrun error detection functions provided
  - DMA transfer support <CSIO (Synchronous serial interface) >
  - Full-duplex double buffering system, 64-step transmission FIFO memory, 64-step reception FIFO memory
  - SPI supported; master and slave systems supported; 5 to 16, 20, 24, 32-bit data length can be set.
  - Built-in dedicated baud rate generator (Master operation)
  - An external clock can be entered. (Slave operation)
  - Overrun error detection function is provided
  - DMA transfer support
  - Serial chip select SPI function <LIN (Asynchronous Serial Interface for LIN) >
  - Full-duplex double buffering system, 64-step transmission FIFO memory, 64-step reception FIFO memory
  - LIN protocol revision 2.1 supported
  - Master and slave systems supported
  - Framing error and overrun error detection
  - LIN synch break generation and detection; LIN synch delimiter generation
  - Built-in dedicated baud rate generator
  - An external clock can be adjusted by the reload counter
  - DMA transfer support
  - Hard assist function < I<sup>2</sup>C >
  - 2 channels ch.3 , ch.4 Standard mode/fast mode supported.
  - 6 channels ch.5 to ch.8, ch.10, ch.11 Standard mode supported.
  - Full-duplex double buffering system, 64-step transmission FIFO memory, 64-step reception FIFO memory
  - Standard mode (Max. 100 kbps) / fast mode (Max. 400 kbps) supported
  - DMA transfer supported (for transmission only)
- CAN Controller (CAN) : 3 channels
  - Transfer speed : Up to 1 Mbps
  - 128-transmission/reception message buffering : 1 channel (ch.0), 64-transmission/reception message buffering : 2 channels (ch.1 and ch.2)
- PPG: 16-bit × Max. 48 channels
  - LED drive output 4 channels 11 ch to 14 ch
  - Reload timer : 16-bit × Max.8 channels
  - Free-run timer : 16-bit × 3 channels 32-bit × Max 3 channels
- Input capture :
  - 16-bit × 4 channels (linked to the free-run timer)
  - 32-bit × Max 6 channels (linked to the free-run timer)
- Output compare :
  - 16-bit × 6 channels (linked to the free-run timer)
  - 32-bit × Max 6 channels (linked to the free-run timer)
- Waveform generator : 6 channels
- Up/Down counter
  - 8-/16-bit Up/Down counter × 2 channels
- Real-time clock (RTC) (for day, hours, minutes, seconds)
  - Main or sub oscillation frequency can be selected for the operation clock
- Calibration: Real-time clock (RTC) of the subclock drive
  - The main clock to sub clock ratio can be corrected by setting the real-time clock prescaler
- Clock Supervisor
  - Monitoring abnormality (by damaged quartz, etc.) of suboscillation (32 kHz) (dual clock products) of the outside and main oscillation (4 MHz)
  - When abnormality is detected, it switches to the CR clock.
  - Initial value ON/OFF can be selected by the part number.
- Base timer : Max.2 channels
  - 16-bit timer
  - Any of four PWM/PPG/PWC/reload timer functions can be selected and used
  - As for the PWC function and the reload timer function, a pair of 16-bit timers can be used as one 32-bit timer in the cascade mode
- CRC generation
- Watchdog timer
  - Hardware watchdog
  - Software watchdog (possible to set the valid range for counter clearing)
- NMI (non-maskable interrupt)
- Interrupt controller
- Interrupt request batch read
  - The interrupt existence from two or more peripherals can be read by a series of register.
- I/O relocation
  - Peripheral function pins can be reassigned.
- Low-power consumption mode
  - Sleep / Stop / Watch / Sub RUN mode
  - Stop (power shutdown) / Watch (power shutdown) mode

- Power-on reset
- Low-voltage detection reset (independently monitor the external power supply and the internal power supply)
  - The external power supply can select initial value ON/OFF by the part number.
- Device Package : 176/144/120/100/80/64
- CMOS 90 nm Technology
- Power supplies
  - 5 V Power supply
  - The internal 1.2 V is generated from 5 V with the voltage step-down circuit

\*1: Only channel 5, channel 6 and channel 11 support the I<sup>2</sup>C (standard mode).

\*2: The initial detection voltage of the external low voltage detection is 2.8 V ± 8 % (2.576 V to 3.024 V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

| Power supply                                          | 2.7 V to 5.5 V <sup>*2</sup>                     |             |             |             |              |
| Package                                               | LQI100                                           |             |             |             |              |

\*1: Only channel 5, channel 6, channel 7, channel 8 and channel 11 support the I2C (standard mode).

\*2: The initial detection voltage of the external low voltage detection is 2.8 V ± 8 % (2.576 V to 3.024 V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

| Operation guaranteed temperature (T <sub>A</sub> ) | -40 °C to +125 °C                                |             |             |             |              |
| Power supply                                       | 2.7 V to 5.5 V <sup>*2</sup>                     |             |             |             |              |
| Package                                            | LQM120                                           |             |             |             |              |

\*1: Only channel 3 and channel 4 support the I<sup>2</sup>C (fast mode/standard mode).

Only channel 5, channel 6, channel 7, channel 8 and channel 11 support the I<sup>2</sup>C (standard mode).

\*2: The initial detection voltage of the external low voltage detection is 2.8 V ± 8 % (2.576 V to 3.024 V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

| Waveform generator                                 | 6 ch                                             |             |             |             |              |
| Operation guaranteed temperature (T <sub>A</sub> ) | -40 °C to +125 °C                                |             |             |             |              |
| Power supply                                       | 2.7 V to 5.5 V <sup>*2</sup>                     |             |             |             |              |
| Package                                            | LQS144, LQN144                                   |             |             |             |              |

\*1: Only channel 3 and channel 4 support the I<sup>2</sup>C (fast mode/standard mode).

Only channel 5, channel 6, channel 7, channel 8, channel 10 and channel 11 support the I<sup>2</sup>C (standard mode).

\*2: The initial detection voltage of the external low voltage detection is 2.8 V ± 8 % (2.576 V to 3.024 V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

## 2. Pin Assignment

### CY91F52xB

CY91F522B, CY91F523B, CY91F524B, CY91F525B, CY91F526B

\* In a single clock product, pin 56 and pin 57 are the general-purpose ports.

**CY91F52xD**

CY91F522D, CY91F523D, CY91F524D, CY91F525D, CY91F526D

\* In a single clock product, pin 70 and pin 71 are the general-purpose ports.

**CY91F52xF**

CY91F522F, CY91F523F, CY91F524F, CY91F525F, CY91F526F

\* In a single clock product, pin 86 and pin 87 are the general-purpose ports.

## CY91F52xJ

CY91F522J, CY91F523J, CY91F524J, CY91F525J, CY91F526J

\* In a single clock product, pin 102 and pin 103 are the general-purpose ports.

**CY91F52xK**

CY91F522K, CY91F523K, CY91F524K, CY91F525K, CY91F526K

\* In a single clock product, pin 121 and pin 122 are the general-purpose ports.

**CY91F52xL**

CY91F522L, CY91F523L, CY91F524L, CY91F525L, CY91F526L

\* In a single clock product, pin 149 and pin 150 are the general-purpose ports.

### 3. Pin Description

| Pin No. |     |     |     |     |     | Pin Name          | Polarity | I/O Circuit types*8 | Function*9                                        |
|---------|-----|-----|-----|-----|-----|-------------------|----------|---------------------|---------------------------------------------------|
| 64      | 80  | 100 | 120 | 144 | 176 |                   |          |                     |                                                   |
| -       | -   | -   | -   | 2   | 2   | P015              | -        | A                   | General-purpose I/O port                          |
|         |     |     |     |     |     | D29               | -        |                     | External bus data bit29 I/O (0)                   |
|         |     |     |     |     |     | TRG0_0            | -        |                     | PPG trigger 0 input (0)                           |
| -       | -   | -   | -   | 3   | 3   | P016              | -        | A                   | General-purpose I/O port                          |
|         |     |     |     |     |     | D30               | -        |                     | External bus data bit30 I/O (0)                   |
|         |     |     |     |     |     | TRG1_0            | -        |                     | PPG trigger 1 input (0)                           |
| -       | -   | -   | -   | -   | 4   | P170              | -        | A                   | General-purpose I/O port                          |
|         |     |     |     |     |     | PPG36_1           | -        |                     | PPG ch.36 output (1)                              |
| -       | -   | -   | -   | 4   | 5   | P017              | -        | A                   | General-purpose I/O port                          |
|         |     |     |     |     |     | D31               | -        |                     | External bus data bit31 I/O (0)                   |

\*1: There is a restriction of pin functions. See "Pin Name" of this table.

\*2: not supported in 64 pin

\*3: not supported in 80 pin

\*4: not supported in 100 pin

\*5: not supported in 120 pin

\*6: not supported in 144 pin

\*7: not supported in 176 pin

\*8: For the I/O circuit types, see [I/O Circuit Type](#).

\*9: For switching, see "I/O Port" in HARDWARE MANUAL.

#### 4. I/O Circuit Type

| Type | Circuit                                                                             | Remarks                                                                                                                                                                             |

## 5. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

### 1. Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

#### ■ Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

#### ■ Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

#### ■ Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

#### (1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

#### (2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

#### (3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

#### ■ Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

**CAUTION:** The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

#### ■ Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

#### ■ Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

#### ■ Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

**CAUTION:** Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

### 2. Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

#### ■ Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

#### ■ Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

#### ■ Lead-Free Packaging

**CAUTION:** When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

#### ■ Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause

absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70 % relative humidity, and at temperatures between 5 °C and 30 °C.  
When you open Dry Package that recommends humidity 40 % to 70 % relative humidity.
- (3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

#### ■ Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125 °C/24 h

#### ■ Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40 % and 70 %. Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).  
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 3. Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

#### (1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

#### (2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

#### (3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

#### (4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

#### (5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

## 6. Handling Devices

This section explains the latch-up prevention and pin processing.

### ■ For latch-up prevention

If a voltage higher than VCC or a voltage lower than VSS is applied to an I/O pin, or if a voltage exceeding the ratings is applied between VCC and VSS pins, a latch-up may occur in CMOS IC. If the latch-up occurs, the power supply current increases excessively and device elements may be damaged by heat. Take care to prevent any voltage from exceeding the maximum ratings in device application.

Also, the analog power supply (AVCC, AVRH) and analog input must not be exceed the digital power supply (VCC) when the power supply to the analog system is turned on or off.

In the correct power-on sequence of the microcontroller, turn on the digital power supply (VCC) and analog power supplies (AVCC, AVRH) simultaneously. Or, turn on the digital power supply (VCC), and then turn on analog power supplies (AVCC, AVRH).

### ■ Treatment of unused pins

If unused input pins are left open, they may cause a permanent damage to the device due to malfunction or latch-up. Connect at least a 2 kΩ resistor to each of the unused pins for pull-up or pull-down processing.

Also, if I/O pins are not used, they must be set to the output state for releasing or they must be set to the input state and treated in the same way as for the input pins.

### ■ Power supply pins

The device is designed to ensure that if the device contains multiple VCC or VSS pins, the pins that should be at the same potential are interconnected to prevent latch-up or other malfunctions. Further, connect these pins to an external power supply or ground to reduce unwanted radiation, prevent strobe signals from malfunctioning due to a raised ground level, and fulfill the total output current standard, etc. As shown in figure 1, all Vss power supply pins must be treated in the similar way. If multiple Vcc or Vss systems are connected, the device cannot operate correctly even within the guaranteed operating range.

Figure 1 Power Supply Input Pins

The power supply pins should be connected to VCC and VSS pins of this device at the low impedance from the power supply source.

In the area close to this device, a ceramic capacitor having the capacitance larger than the capacitor of C pin is recommended to use as a bypass capacitor between VCC and VSS pins.

■ Crystal oscillation circuit

An external noise to the X0 or X1 pin may cause a device malfunction. The printed circuit board must be designed to lay out X0 and X1 pins, crystal oscillator (or ceramic resonator), and the bypass capacitor to be grounded to the close position to the device.

The printed circuit board artwork is recommended to surround the X0 and X1 pins by ground circuits.

■ Mode pins (MD1, MD0)

Connect the MD1 and MD0 mode pins to the VCC or VSS pin directly. To prevent an erroneous selection of test mode caused by the noise, reduce the pattern length between each mode pin and VCC or VSS pin on the printed circuit board. Also, use the low-impedance pin connection.

■ During power-on

To prevent a malfunction of the voltage step-down circuit built in the device, the voltage rising must be monotonic during power-on.

■ Notes during PLL clock operation

When the PLL clock is selected and if the oscillator is disconnected or if the input is stopped, this clock may continue to operate at the free running frequency of the self-oscillator circuit built in the PLL clock. This operation is not guaranteed.

■ Treatment of A/D converter power supply pins

Connect the pins to have  $AVCC = AVRH = VCC$  and  $AVSS/AVRL = VSS$  even if the A/D converter is not used.

■ Notes on using external clock

An external clock is not supported. None of the external direct clock input can be used for both main clock and sub clock.

■ Power-on sequence of A/D converter analog inputs

Be sure to turn on the digital power supply (Vcc) first, and then turn on the A/D converter power supplies (AVcc, AVRH, AVRL) and analog inputs (AN0 to AN47). Also, turn off the A/D converter power supplies and analog inputs first, and then turn off the digital power supply (Vcc). When the AVRH pin voltage is turned on or off, it must not exceed AVCC. Even if a common analog input pin is used as an input port, its input voltage must not exceed AVcc. (However, the analog power supply and digital power supply can be turned on or off simultaneously.)

■ Treatment of C pin

This device contains a voltage step-down circuit. A capacitor must always be connected to the C pin to assure the internal stabilization of the device. For the standard values, see the "Recommended Operating Conditions" of the latest data sheet.

**Note:** Please see the latest data sheet for a detailed specification of the operation voltage.

■ Function switching of a multiplexed port

To switch between the port function and the multiplexed pin function, use the PFR (port function register). However, if a pin is also used for an external bus, its function is switched by the external bus setting. For details, see "I/O PORTS" in the hardware manual.

■ Low-power consumption mode

To transit to the sleep mode, watch mode, stop mode, watch mode(power-off) or stop mode(power-off), follow the procedure explained in "Activating the sleep mode, watch mode, or stop mode" or "Activating the watch mode (power-off) or stop mode(power-off)" of "POWER CONSUMPTION CONTROL" in the hardware manual.

Take the following notes when using a monitor debugger.

- Do not set a break point for the low-power consumption transition program.
- Do not execute an operation step for the low-power consumption transition program.

■ Notes When Writing Data in a Register Having the Status Flag

When writing data in the register that has a status flag (especially, an interrupt request flag) to control function, taking care not to clear its status flag erroneously must be followed.

The program must be written not to clear the flag to the status bit, and then to set the control bits to have the desired value.

Especially, if multiple control bits are used, the bit instruction cannot be used. (The bit instruction can access to a single bit only.) By the Byte, Half-word, or Word access, data is written to the control bits and status flag simultaneously. During this time, take care not to clear other bits (in this case, the bits of status flag) erroneously.

**Note:** These points can be ignored because the bit instructions are already taken the points into consideration.

## 7. Block Diagram

**CY91F522D, CY91F523D, CY91F524D, CY91F525D, CY91F526D**

**CY91F522F, CY91F523F, CY91F524F, CY91F525F, CY91F526F**

**CY91F522J, CY91F523J, CY91F524J, CY91F525J, CY91F526J**

The diagram illustrates the system architecture of the FR81s CPU core. At the top, the **Regulator** (Power-on reset, CR oscillator) and **FR81s CPU core** (M P U, Instruction, Data) are connected to the **Debug Interface**. The **XBS Crossbar Switch** (Wild register) manages data flow between the CPU core, **RAM** (48K/64K/96K/128K), **Flash** (Main Flash: 256K/384K/512K/768K/1024KB +64KB; WorkFlash 64KB), and the **Timing Protection Unit**.

The **On-chip bus (AHB)** consists of **On-chip bus layer 1** and **On-chip bus layer 2**. It connects to various components:

- External Bus I/F** (RX, TX)
- CAN (3ch)**
- Clock / Bus Bridge**
- RAM ECC Control (XBS RAM)**
- RAM ECC Control (BackUp RAM)**
- BackUp RAM +8KB**
- Peripheral Bus Bridge** (16, 32)
- DMAC (16 ch)**
- Bus performance counter**
- Operation mode register** (MD0, MD1, P006)

The **10bit Peripheral Bus** and **32bit Peripheral Bus (APB)** connect to various peripheral modules:

- Left Side (10bit Peripheral Bus):** Async Bus Bridge (PCLK1 <-> PCLK2), CAN prescaler, RTC/WDT1 Calibration, I/O port setting, 32bit Free-run timer (3ch), 32bit Input capture (6ch), 32bit Output compare (6ch), Base timer (2ch), U/D counter (2ch), Reload timer (8ch), 8bit DA converter (2ch), Clock monitor, Watchdog timer (SW and HW), DMA transfer request generate/clear, Interrupt request batch read, Clock control (divide control), Reset control register, Low-power consumption setting register, Delay interrupt, and Interrupt controller.
- Right Side (32bit Peripheral Bus):** Async Bus Bridge (PCLK1 <-> PCLK2), CRC, Wave generator (6ch), 16bit Free-run timer (3ch), 16bit Input capture (4ch), 16bit Output compare (6ch), 12bit AD converter (32ch + 16ch), Multi-function serial interface (12ch), Bus Bridge (32bit <-> 16bit), PPG (44ch), Bus Bridge (32bit <-> 16bit), External interrupt input (16ch), Real time clock, Clock supervisor, NMI (NMIX), Low-voltage detection (External power supply low-voltage detection), Low-voltage detection (Internal power supply low-voltage detection), and Clock control (Clock setting, Main timer, Sub timer, PLL timer).

The **I/O Port** on the left includes signals: RX, TX, D/A, ASX, CS, RDX, WRX, SYSClk, RDY, FRCK, ICU, OCU, TIOA, TIOB, AIN, BIN, ZIN, TIN, TOT, DAO, and MONCLK. The **I/O Port** on the right includes signals: DTTI, RTO, FRCK, ICU, ADTG, AIN, ADC enable (ADER), SOUT, SIN, SCK, TRG, PPG, INT, and WOT.

## 9. I/O Map

The following I/O map shows the relationship between memory space and registers for peripheral resources.

Legend of I/O Map

| Address             | Address offset value/ register name        |                                |                                                     |                                | Block         |
|---------------------|--------------------------------------------|--------------------------------|-----------------------------------------------------|--------------------------------|---------------|
|                     | +0                                         | +1                             | +2                                                  | +3                             |               |

Read/Write attribute (R: Read W: Write)

Initial register value after reset

Data access attribute  
B: Byte  
H: Half-word  
W: Word  
(Note)The access by the data  
access attribute not described  
is disabled.

The initial register value after reset indicates as follows:

- "1": Initial value "1"
- "0": Initial value "0"
- "X": Initial value undefined
- "-": Reserved bit/Undefined bit
- "\*": Initial value "0" or "1" according to the setting

**Note:** The access to addresses not described is disabled.

| Address                                          | Address offset value / Register name |                                                |                                         |                                   | Block                                  |

[S]: It is a system register. The illegal instruction exception (data access error) is generated in these registers in the user mode when reading and writing to it.

## 10. Interrupt Vector Table

This list shows the assignments of interrupt factors and interrupt vectors/interrupt control registers.

### Interrupt Vector 64 Pins

| Interrupt Factor                                              | Interrupt Number |              | Interrupt Level               | Offset           | Default Address for TBR | RN               |
|---------------------------------------------------------------|------------------|--------------|-------------------------------|------------------|-------------------------|------------------|
|                                                               | Decimal          | Hexa Decimal |                               |                  |                         |                  |

**Note:** It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.

\*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.

\*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.

\*4: The clock calibration unit does not support a DMA transfer by the interrupt.

\*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.

\*6: There is no resource corresponding to the interrupt level.

\*7: It does not support a DMA transfer by the external low-voltage detection interrupt.

\*8: REALOS is a trademark of Cypress.

**80 Pins**

Note: It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.

\*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.

\*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.

\*4: The clock calibration unit does not support a DMA transfer by the interrupt.

\*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.

\*6: There is no resource corresponding to the interrupt level.

\*7: It does not support a DMA transfer by the external low-voltage detection interrupt.

**100 Pins**

Note: It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.

\*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.

\*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.

\*4: The clock calibration unit does not support a DMA transfer by the interrupt.

\*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.

\*6: There is no resource corresponding to the interrupt level.

\*7: It does not support a DMA transfer by the external low-voltage detection interrupt.

**120 Pins**

| Interrupt Factor                                              | Interrupt Number |              | Interrupt Level               | Offset           | Default Address for TBR | RN   |

**Note:** It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.

\*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.

\*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.

\*4: The clock calibration unit does not support a DMA transfer by the interrupt.

\*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.

\*6: There is no resource corresponding to the interrupt level.

\*7: It does not support a DMA transfer by the external low-voltage detection interrupt.

**144 Pins**

**Note:** It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

- \*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.
- \*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.
- \*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.
- \*4: The clock calibration unit does not support a DMA transfer by the interrupt.
- \*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.
- \*6: There is no resource corresponding to the interrupt level.
- \*7: It does not support a DMA transfer by the external low-voltage detection interrupt.

**176 Pins**

**Note:** It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

- \*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.
- \*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.
- \*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.
- \*4: The clock calibration unit does not support a DMA transfer by the interrupt.
- \*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.
- \*6: There is no resource corresponding to the interrupt level.
- \*7: It does not support a DMA transfer by the external low-voltage detection interrupt.

## 11. Electrical Characteristics

\*1: These parameters are based on the condition that V<sub>SS</sub> = AV<sub>SS</sub> = 0.0 V

\*2: Caution must be taken that AV<sub>CC</sub>, AVRH do not exceed V<sub>CC</sub> upon power-on and under other circumstances.

\*3: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

\*4: The average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current × the operation ratio.

\*5: The total output current is defined as the maximum current value flowing through all of corresponding pins.

\*6: · Corresponding pins: all general-purpose ports except P035, 041, 093, 122.

· Use within recommended operating conditions.

· Use at DC voltage (current).

· The + B signal should always be applied by connecting a limiting resistor between the + B signal and the microcontroller.

· The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the + B signal is input.

· Note that when the microcontroller drive current is low, such as in the low power consumption modes, the + B input potential can increase the potential at the V<sub>CC</sub> pin via a protective diode, possibly affecting other devices.

· Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.

· Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.

· Do not leave + B input pins open.

\*7: When it is used under this condition, contact your sales representative.

\*8: It is a standard when four-layer substrate is used.

\*9: Corresponding pins: General-purpose ports other than those of P103, P104, P105 and P106.

\*10: Corresponding pins: General-purpose ports of P103, P104, P105 and P106.

Sample Recommended Circuit

#### <WARNING>

Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

#### Recommended Operating Conditions

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

\*1: When it is used outside recommended operation guarantee range (range of the operation guarantee), contact your sales representative.

The initial detection voltage of the external low voltage detection is  $2.8\text{ V} \pm 8\%$  (2.576 V to 3.024 V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the

minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

\*2: See the following diagram for details on the connection of smoothing capacitor  $C_s$ .

\*3: When it is used under this condition, contact your sales representative.

#### <WARNING>

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.

Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

Internal operation clock frequency vs. Power supply voltage

**Note:** The power supply voltage, which is the low-voltage detection setting voltage or lower, is in the reset state.

Oscillation clock frequency vs. Internal operation clock frequency

|                             |       | Internal operation clock frequency |                 |                 |                 |                 |     |                  |                  |
|-----------------------------|-------|------------------------------------|-----------------|-----------------|-----------------|-----------------|-----|------------------|------------------|
|                             |       | Main Clock                         | PLL clock       |                 |                 |                 |     |                  |                  |
|                             |       |                                    | Multiplied by 1 | Multiplied by 2 | Multiplied by 3 | Multiplied by 4 | ... | Multiplied by 19 | Multiplied by 20 |
| Oscillation clock frequency | 4 MHz | 2 MHz                              | 4 MHz           | 8 MHz           | 12 MHz          | 16 MHz          | ... | 76 MHz           | 80 MHz           |

• Example of oscillation circuit

**Note:** As to the product with its clock supervisor's initial value is "ON", when the oscillator is unable to start within 20 ms from the stop state the clock supervisor will detect the oscillation stop. As a result, the CPU moves to the fail safe operation.

Design your print circuit board so that the oscillator can start oscillation within 20 ms. Moreover, it is recommended to be designed after the match evaluation of the circuit is requested to the departure pendulum maker when the oscillation circuit is composed.

AC characteristics are specified by the following measurement reference voltage values.

## (2) Reset Input

(T<sub>A</sub>: -40 °C to +125 °C, V<sub>CC</sub> = AV<sub>CC</sub> = 5.0 V ± 10 %/V<sub>CC</sub> = AV<sub>CC</sub> = 3.3 V ± 0.3 V, V<sub>SS</sub> = AV<sub>SS</sub> = 0.0 V)

| Parameter                     | Symbol            | Pin Name | Conditions | Value                                |     | Unit | Remarks                                   |
|-------------------------------|-------------------|----------|------------|--------------------------------------|-----|------|-------------------------------------------|
|                               |                   |          |            | Min                                  | Max |      |                                           |
| Reset input time              | t <sub>RSTL</sub> | RSTX     | —          | 10                                   | —   | μs   | When normal operation                     |
|                               |                   |          |            | Oscillation time of oscillator* +100 | —   | μs   | At Stop mode<br>At Power-on* <sup>2</sup> |
|                               |                   |          |            | 100                                  | —   | μs   | At Watch mode                             |
| Width for reset input removal |                   |          |            | 1                                    | —   | μs   |                                           |

\*1: The oscillation time of the oscillator is the time it takes for the amplitude of the oscillations to reach 90 %. For crystal oscillators, this time is between several ms and several tens of ms, for ceramic oscillators the time is between several hundred μs and several ms, and for an external clock, the time is 0 ms.

\*2: In case of using CY91F52xxxD or CY91F52xxxE and corresponding to note in (3) Power-on Conditions of next subsection, assert RSTX with power-on.

### (3) Power-on Conditions

(3-1) [CY9152xxxB/CY9152xxxC/CY9152xxxD]

(T<sub>A</sub>: -40 °C to +125 °C, V<sub>SS</sub> = 0.0 V)

| Parameter                        | Symbol           | Pin Name        | Conditions                            | Value |     |       | Unit  | Remarks |
|----------------------------------|------------------|-----------------|---------------------------------------|-------|-----|-------|-------|---------|
|                                  |                  |                 |                                       | Min   | Typ | Max   |       |         |
| Level detection voltage          | —                | V <sub>CC</sub> | —                                     | 2.024 | 2.2 | 2.376 | V     |         |
| Level detection hysteresis width | —                | V <sub>CC</sub> | —                                     | —     | 100 | —     | mV    |         |
| Level detection time             | —                | —               | —                                     | —     | —   | 30    | μs    | *1      |
| Power off time                   | t <sub>OFF</sub> | V <sub>CC</sub> | —                                     | 50    | —   | —     | ms    | *2      |
| Power ramp rate                  | dV/dt            | V <sub>CC</sub> | V <sub>CC</sub> :<br>0.2 V to 2.376 V | —     | —   | 4     | mV/μs | *3      |
| C pin voltage at Power-on        | —                | C               | —                                     | —     | —   | 60    | mV    | *4      |

\*1: This spec is at 4 mV/μs of power ramp rate. If the power ramp rate is faster than 4mV/μs, there is the possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

\*2: V<sub>CC</sub> must be held below 0.2 V for a minimum period of t<sub>OFF</sub>.

\*3: Power-on can detect by satisfying power ramp rate when power off time is not satisfied.

\*4: C-pin voltage is below 60 mV when V<sub>CC</sub> is turned on again.

#### Note:

When using CY91F52xxxB/C, either \*2 or \*3 or \*4 must be satisfied. When neither \*2 nor \*3 nor \*4 can be satisfied, use CY91F52xxxD and assert external reset (RSTX) at power-up and at any brownout event.

#### • Power off time, Power ramp rate, C pin voltage at Power-on

(3-2) [CY9152xxxE]

(TA: -40 °C to +125 °C, VSS = 0.0 V)

| Parameter                                                   | Symbol | Pin Name | Conditions                                   | Value |     |       | Unit  | Remarks |
|-------------------------------------------------------------|--------|----------|----------------------------------------------|-------|-----|-------|-------|---------|
|                                                             |        |          |                                              | Min   | Typ | Max   |       |         |
| Level detection voltage                                     | –      | VCC      | –                                            | 2.024 | 2.2 | 2.376 | V     |         |
| Level detection hysteresis width                            | –      | VCC      | –                                            | –     | 100 | –     | mV    |         |
| Level detection time                                        | –      | –        | –                                            | –     | –   | 30    | μs    | *1      |
| Power off time                                              | tOFF1  | VCC      | VCC ≤ 0.2 V                                  | 50    | –   | –     | ms    | *2      |
|                                                             | tOFF2  | VCC      | VCC ≤ 1.3 V                                  | 100   | –   | –     | μs    | *4      |
| Power ramp rate                                             | dV/dt  | VCC      | VCC:<br>0.2 V to 2.376 V<br>(tOFF1 < 50 ms)  | –     | –   | 50    | mV/μs | *3      |
|                                                             | dV/dt  | VCC      | VCC:<br>1.3 V to 2.376 V<br>(tOFF2 ≥ 100 μs) | –     | –   | 1000  | mV/μs | *4      |
| C pin voltage at Power-on                                   | –      | C        | –                                            | –     | –   | 60    | mV    | *5      |
| Maximum ramp rate guaranteed to not generate power-on reset | dV/dt  | VCC      | VCC:<br>Between 2.4 V and 4.5 V              | –     | –   | 50    | mV/μs | *6      |

\*1: The specified level detection time applies only for power ramp rate of 1000 mV/μs or less.

\*2: VCC must be held below 0.2 V for a minimum period of tOFF1.

\*3: Power-on can detect by satisfying power ramp rate when tOFF1 is not satisfied.

\*4: VCC must be held below 1.3 V for a minimum period of tOFF2.

Power ramp rate must be 1000 mV/μs or less from 1.3 V to 2.376 V.

Power-on can detect by satisfying power ramp rate and power off time.

\*5: C-pin voltage is below 60 mV when VCC is turned on again.

\*6: This specification is specified the power supply fluctuation after power on detection. When VCC voltage is between 2.4 V and 4.5 V, the power supply fluctuation is below 50 mV/μs, the detection of power-on is suppressed. The power-on does not detect in any power fluctuation between 4.5 V and 5.5 V.

Note: When using CY91F52xxxE, either \*2 or \*3 or \*4 or \*5 must be satisfied. When neither \*2 nor \*3 nor \*4 nor \*5 can be satisfied, assert external reset (RSTX) at power-up and at any brownout event.

#### Notes:

AC characteristic in CLK synchronized mode.

C<sub>L</sub> is the load capacitance applied to pins during testing.

The maximum baud rate is limited by internal operation clock used and other parameters. Please use ch.3 and ch.4 with maximum baud rate 400 kbps or less.

See Hardware Manual for details.

□ Internal shift clock mode

**Notes:**

AC characteristic in CLK synchronized mode.

C<sub>L</sub> is the load capacitance applied to pins during testing.

The maximum baud rate is limited by internal operation clock used and other parameters. Please use ch.3 and ch.4 with maximum baud rate 400 kbps or less.

See Hardware Manual for details.

• Internal shift clock mode

• External shift clock mode

\*: It writes in the TDR register and, then, it changes.

\*1: t<sub>CSSU</sub> = SCSTR:CSSU7-0 × Serial chip select timing operating clock

\*2: t<sub>CSHD</sub> = SCSTR:CSHD7-0 × Serial chip select timing operating clock

\*3: t<sub>CSDS</sub> = SCSTR:CSDS15-0 × Serial chip select timing operating clock

Regardless of the deselect time setting, once after the serial chip select pin becomes inactive, it will take at least five peripheral bus clock cycles to be active again

Please see the hardware manual for details of above-mentioned \*1,\*2, and \*3

When Serial chip select is used , Serial clock output mark level "L",  
Serial chip select Inactive level "H"  
Internal shift clock mode

When Serial chip select is used , Serial clock output mark level "L",  
Serial chip select Inactive level "H"  
External shift clock mode

When Serial chip select is used , Serial clock output mark level "L",  
 Serial chip select Inactive level "H"  
 Internal shift clock mode , Example of switching clock by round operation (x,y=0,1,2,3)

(4-1-7) Bit setting: SMR:MD2 = 0, SMR:MD1 = 1, SMR:MD0 = 0,

When Serial chip select is used : SCSCR:CSEN = 1,

Serial clock output mark level "H" : SMR,SCSFR:SCINV = 0,

Serial chip select Inactive level "L" : SCSCR,SCSFR:CSLVL = 0

Notes: Only ch.3 and ch.4 are standard mode/fast mode correspondence. In ch.5-ch.8, ch.10, and ch.11, only a standard mode is correspondences.

\*1: R and C<sub>L</sub> represent the pull-up resistance and load capacitance of the SCL and SDA output lines, respectively.

V<sub>P</sub> shows that the power-supply voltage of the pull-up resistor and I<sub>OL</sub> shows the V<sub>OL</sub> guarantee current.

\*2: The maximum t<sub>HDDAT</sub> only has to be met if the device does not extend the "L" width (t<sub>LOW</sub>) of the SCL signal.

\*3: A fast mode I<sup>2</sup>C bus device can be used on a standard mode I<sup>2</sup>C bus system as long as the device satisfies the requirement of

" $t_{SUDAT} \geq 250 \text{ ns}$ ".

\*4:  $t_{CPP}$  is the peripheral clock cycle time. Adjust the clock of the bus in the surrounding to 8 MHz or more when use I<sup>2</sup>C.

\*1: If the fluctuation of the power supply is faster than the low voltage detection time, there is a possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

\*2: Please suppress the change of the power supply within the range of the power-supply voltage regulation to do a low voltage detection by detecting voltage (V<sub>DL</sub>).

\*3: The initial detection voltage of the external low voltage detection is 2.8 V ± 8 % (2.576 V to 3.024 V).

This LVD setting cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as this detection level is below the minimum guaranteed MCU operation voltage (2.7 V).

Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

**(9) Low voltage detection (Internal low-voltage detection)**

(TA: -40 °C to +125 °C, VSS = AVSS = 0.0 V)

| Parameter                  | Symbol            | Pin Name | Conditions | Value |     |     | Unit | Remarks                         |
|----------------------------|-------------------|----------|------------|-------|-----|-----|------|---------------------------------|
|                            |                   |          |            | Min   | Typ | Max |      |                                 |
| Power supply voltage range | V <sub>RDP5</sub> | -        | -          | 0.6   | -   | 1.4 | V    |                                 |
| Detection voltage*2        | V <sub>RDL</sub>  |          | *1         | 0.8   | 0.9 | 1.0 | V    | When power-supply voltage falls |
| Hysteresis width           | V <sub>RHYS</sub> |          | -          | -     | 0.1 | -   | V    | When power-supply voltage rises |
| Low voltage detection time | -                 | -        | -          | -     | -   | 30  | μs   |                                 |

\*1: If the fluctuation of the power supply is faster than the low voltage detection time, there is a possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

\*2: The detection voltage of the internal low voltage detection is 0.9 V ± 0.1 V.

This LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as this detection level is below the minimum guaranteed MCU operation voltage.

Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

\*1: Time for each channel.

\*2: Power supply current (VCC = AVCC = 5.0 V) is specified if A/D converter is not operating and CPU is stopped.

\*3: The power supply current described only current value on A/D converter.

The total AVCC current value must be calculated the power supply current for A/D converter and D/A converter.

(Note) Please use the clock of 0.5 MHz-20 MHz for the output clock of A/D converter to guarantee accuracy.

## (2) Definition of A/D Converter Terms

- Resolution** : Analog variation that is recognized by an A/D converter.
- Linearity error** : Deviation of the actual conversion characteristics from a straight line that connects the zero transition point ("0000 0000 0000" ← → "0000 0000 0001") to the full-scale transition point ("1111 1111 1110" ← → "1111 1111 1111").
- Differential linearity error** : Deviation of the input voltage from the ideal value that is required to change the output code by 1LSB.

### (3) Notes on Using A/D Converter

<About the output impedance of the analog input of external circuit>

When the external impedance is too high, the sampling period for analog voltages may not be sufficient. In this case, it is recommended to connect the capacitor (approx. 0.1  $\mu\text{F}$ ) to the analog input pin.

- Analog input circuit model

| 8-bit writing time                              | –                                                                                       | 9   | 288  | μs   | Exclusive of overhead time at system level* <sup>1</sup>                |
| 16-bit writing time                             | –                                                                                       | 12  | 384  | μs   | Exclusive of overhead time at system level* <sup>1</sup>                |
| ECC writing time                                | –                                                                                       | 9   | 288  | μs   | Exclusive of overhead time at system level* <sup>1</sup>                |
| Erase cycle* <sup>2</sup> /<br>Data retain time | 1,000 cycles/<br>20 years,<br>10,000 cycles/<br>10 years,<br>100,000 cycles/<br>5 years | –   | –    | –    | Average T <sub>A</sub> = +85 °C* <sup>3</sup>                           |

\*1: The guaranteed value for erasure up to 100,000 cycles.

\*2: Number of erase cycles for each sector.

\*3: This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at + 85 °C).

**(2) Notes**

While the Flash memory is written or erased, shutdown of the external power (V<sub>CC</sub>) is prohibited.

In the application system where V<sub>CC</sub> might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function.

To put it concretely, after the external power supply voltage falls below the detection voltage (V<sub>DL</sub>\*), hold V<sub>CC</sub> at 2.7 V or more within the duration calculated by the following expression:

$$Td^*[\mu s] + (\text{period of PCLK} [\mu s] \times 257) + 50 [\mu s]$$

\*: See "4.AC Characteristics (8) Low-voltage detection (External low-voltage detection) "

**D/A Converter**

(T<sub>A</sub>: -40 °C to +125 °C, V<sub>CC</sub> = AV<sub>CC</sub> = 5.0 V ± 10 %/V<sub>CC</sub> = AV<sub>CC</sub> = 3.3 V ± 0.3 V, V<sub>SS</sub> = AV<sub>SS</sub> = 0.0 V)

| Parameter                    | Symbol          | Pin Name | Condition | Value |      |       | Unit | Remarks                        |

## NOTES

- CONTROLLING DIMENSIONS ARE IN MILLIMETERS (mm)
- DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
- DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
- TO BE DETERMINED AT SEATING PLANE C.
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
- DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
- REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
- DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBER PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
- THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
- A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

## 18. Errata

This section describes the errata for the CY91520 Series. Details include errata trigger conditions, scope of impact, available workarounds, and silicon revision applicability. Contact your local Cypress Sales Representative if you have questions.

### Part Numbers Affected

| Part Number         |
|---------------------|
| CY91F522B/D/F/J/K/L |
| CY91F523B/D/F/J/K/L |
| CY91F524B/D/F/J/K/L |
| CY91F525B/D/F/J/K/L |
| CY91F526B/D/F/J/K/L |

### CY91F522/3/4/5/6 Qualification Status

Product Status: Production

### Errata Summary

The following table defines the errata applicability to available CY91520 Series devices.

| Items                                                                 | Part Number                                                       | Silicon Revision | Fix Status                                       |
|-----------------------------------------------------------------------|-------------------------------------------------------------------|------------------|--------------------------------------------------|

| [2]. Limitation for Watch mode (power off)                            | CY91F525B/D/F/J/K/L<br>CY91F526B/D/F/J/K/L                        | B, C, D, E       | -                                                |

#### 1. Power-on Conditions is not enough in the Datasheet Specification

##### ■ Problem Definition

If the Power-On-Reset and Internal Low Voltage Detection are not generated, some port functions will not be available.

##### ■ Parameters Affected

$t_{OFF}$  for Power off time on Power-on Conditions

VCC Power ramp rate on Power-on Conditions

##### ■ Trigger Condition

When the power supply voltage to the MCU has been turned off but has not reached 0 V when the power supply voltage is turned on again, MCU does not generate an internal power-on-reset signal (Power-On reset or Internal LVD reset). Then, some port functions will not be available.

If below condition (1) or (2) or (3) is satisfied, Power-On Reset (Initialization-Reset signal) is generated and no problem occurs.

- (1) The VCC voltage is less than 200 mV for 50 ms or longer ( $t_{OFF}$ )
- (2) VCC Power ramp rate less than 4 mV/ $\mu$ s (dV/dt) until a voltage level for a safe Power-On detection is reached
- (3) C-pin voltage is below 60 mV when VCC is turned on again

### ■ Scope of Impact

For the affected parts, when the Power-On Reset and Internal Low Voltage Detection are not generated, the MCU may set invalid package and sub clock option information. Therefore, the MCU may operate with an invalid pin configuration.

### ■ Workaround

For the affected parts, it is necessary to satisfy at least one of the Power-On Reset requirements for any Power-On event as given below:

- (1) The VCC voltage is less than 200 mV for 50 ms or longer ( $t_{OFF}$ )
- (2) VCC Power ramp rate is less than 4 mV/ $\mu$ s (dV/dt) until a voltage level for a safe Power-On detection is reached
- (3) C-pin voltage is below 60 mV when VCC is turned on again

If the customer system does not satisfy the condition above-mentioned, Cypress will release new version D, so Cypress recommends the version D for CY91F52x. The new version prevents the limitation when an external reset signal is asserted at pin RSTX anytime the supply voltage (VCC) is turned on.

### ■ Fix Status

Will be fixed in production silicon version D, E

## 2. Limitation for Watch mode (power off)

### ■ Problem Definition

If the below all trigger conditions (1) to (3) are satisfied, the below registers will be initialized after MCU recovers from watch mode (power off).

### ■ Trigger Conditions

- (1) Using the watch mode (power off)
- (2) Interrupt levels that are used as sources for recovering from the watch mode (power off) are '16' to '30', or using NMIX pin as source for recovering from the watch mode (power off)
- (3) The sources for recovering from the watch mode (power off) are generated between PCLK 1 cycle and PMUCLK 3 cycles (\*), after CPU state changes to the watch mode (power off)  
(\*): In case of PCLK = 0.5 MHz and PMUCLK = 32 kHz, it is approx. 2  $\mu$ s to 100  $\mu$ s

### ■ Scope of Impact

If the all trigger conditions (1) to (3) are satisfied, the below registers will be initialized after MCU recovers from watch mode (power off).

WTCRH, WTCRM, WTCRL  
CSELR.SCEN  
CMONR.SCRDY  
CCRTSELR.CST  
CCRTSELR.CSC

**■ Workaround**

It is necessary to satisfy the below both conditions of (1) and (2).

- (1) Interrupt levels that are used as sources for recovering from the watch mode (power off) are '31', before CPU state changes to the watch mode (power off)
- (2) Don't use NMIX pin as source for recovering from the watch mode (power off)

**■ Fix Status**

Will not be planned

## 19. Major Changes

Spanson Publication Number: MB91F526L\_DS705-00011
