

STARSHIELD™

ZERO LENGTH SHIELD TERMINATION BACKSHELLS

FOR RUGGED EMI/RFI APPLICATIONS

DECEMBER 2012

WHAT IS STARSHIELD™ “ZERO LENGTH SHIELD TERMINATION?”

For decades, bundles of individually shielded cables have been used to solve many electrical system design issues from cross-talk to wire-routing/management and maintenance. These individual shields were frequently “pigtailed” by pulling the center conductors through the outer shield, or by soldering drain-wires to the shield, then terminating these pigtails or drain wires via a terminal lug to the cable-clamp on the back of the connector.

Pigtails or drain wires, suffer from several shortcomings. First, they force shield current to flow in an asymmetrical manner yielding higher transfer impedances. Second, and perhaps more importantly, the pigtail or drain-wire itself creates a “loop in the shield” or “standing antenna” effect. Coupled with the exposed lengths of unshielded wires, this condition acts as a receptor and/or radiator of noise. EMC performance will drop to unacceptable levels at higher frequencies dependent on the length of the pigtail. Over the years, more elegant methods of terminating pigtails or drain-wires have been developed that effectively shorten these lengths, however the underlying issue still exists—particularly in higher-bandwidth and less noise-tolerant applications which demand ever-shorter pigtail lengths for acceptable performance.

The best connection is one in which the individual shields are extended up to and make solid 360° connections to the backshell leaving no length of unshielded wires exposed outside of the ground plane. Effectively, this reduces the length of the pigtails or drain-wires to zero, and eliminates the standing antenna. Said another way, Zero Length Shield Termination may be achieved via a 360° termination of signal group shields (the individual shields over the wires or twisted pairs in a bundle) to an encapsulating ground in which no pigtails or drain wires are necessary to terminate the shields to the connector body or backshell.

Glenair’s StarShield “Zero Length Shield Termination” backshell methodology excludes pigtails or drain-wires altogether by providing termination platforms referred to as “ferrules” which allow individual shields to be terminated by a 360° solder connection in one easy process. The ferrules in-turn lock into a “star” that provide another 360° termination to the encapsulating ground plane of the backshell body. By eliminating the issues associated with pigtails or drain-wires, this system not only offers the highest level of EMC performance, but is also one of the most reliable, repairable individual shield termination methods on the market today.

Introduction to StarShield™ Shield Termination Backshells

A

Product Features

- The unique StarShield™ configuration completely eliminates “standing antenna” problems common with pigtail shield termination systems.
- The backshell utilizes familiar heat shrink termination (HST) sleeve technology for fast and reliable termination of shielding—even with dissimilar wire types and gauges.
- The StarShield™ system is available in a standard configuration featuring a threaded compression nut and a tapered split-ring that fits snugly into a conical backshell or a lightweight split banding version.
- Available fittings include EMI shield termination and shrink-boot backshells.

“Zero Length” Individual Shield Termination Backshells

The Glenair Series 470-013 StarShield™ “Zero Length” Individual Shield Termination Backshell offers optimal grounding of EMI/EMP braided shielding. The unique StarShield™ configuration completely eliminates the need for the termination of additional shield drain wires or pigtails. The backshell utilizes familiar solder sleeve technology for fast and reliable termination of shielding—even with dissimilar wire types and gauges. The internal configuration of the StarShield™ features a tapered split-ring that fits snugly into the conically machined backshell. Tightening the coupling nut in place effects 360° grounding of all conductive surfaces. Standard designs include banding and shrink-boot versions.

Test Description	StarShield™ Performance Requirements	Procedure
Magnetic Permeability	Relative permeability less than 2.0 for aluminum and 5.0 for stainless steel.	EIA-364.54
DC resistance	Resistance was measured between connector/fixture, and ferrule or a point near the end of the cable shield. Cable shield resistance was subtracted when measuring to a point near the end of the cable shield. The DC resistance did not exceed 5 milliohms after conditioning.	EIA-364.6
Durability	Backshells subjected to 10 cycles of assembly and disassembly (not including HST device). Showed no evidence of damage detrimental to performance.	GPS470013
Temperature Cycling	Condition IV, 5 cycles, except steps 2 and 4 were 2 minutes maximum duration. The temperature of step 1 was -65°C and temperature of step 3 was +200°C for nickel-plated Backshells with nickel-plated copper braids, +175°C for cadmium plated Backshells or silver-plated braids, or +150°C for tin-plated copper braids. After conditioning, Backshells met the subsequent performance requirements and showed no evidence of damage detrimental to performance.	EIA-364.32, condition IV and GPS470013
Temperature Aging	Backshells were subjected to maximum operating temperatures for a period of 1,000 hours. After conditioning, Backshells met the subsequent performance requirements and showed no evidence of damage detrimental to performance.	GPS470013
Coupling Thread Strength	After testing, backshell showed no evidence of damage detrimental to performance.	SAE AS85049 category 3A
Vibration	Backshell was torqued to a suitable test fixture representative of an actual connector. Cable bundle was clamped or otherwise secured at 10.0 +/- .5 inches from the test fixture. After testing, Backshell showed no evidence of loosening or damage detrimental to performance with no discontinuities >1g5.	EIA-364.28 Condition VI, letter J 8 hrs/axis, monitored
Shock	The pulse was approximate half sine wave of 300 G ± 15 percent magnitude with duration of 3 ± 1 milliseconds. The wire bundle was clamped or otherwise secured at 10.0 +/- .5 inches from the test fixture. After testing, Backshell showed no evidence of loosening or damage detrimental to performance with no discontinuities >1g5.	EIA-364.27
Bending Moment	After testing, backshell showed no evidence of loosening or damage detrimental to performance.	AS85049, category 3A (heavy duty)
Cable Pull-out	A minimum of one ferrule per backshell was tested and wired with 4 shielded twisted pairs. DC resistance was monitored during the test. DC resistance during the test did not exceed 7 milliohms.	EIA364.38, condition E (25lbs)
Salt-Spray (Corrosion)	The samples were suspended from the top of the chamber using waxed twine or string, glass rods or glass cord. StarShield™ backshells showed no signs of basis metal exposure which may affect performance as defined in AIR4789	EIA364.26 test condition letter A (96hrs) and test condition letter C (500hrs)
Fluid Immersion	One sample per fluid. StarShield™ backshell and HST devices showed no signs of swelling, cracking or other evidence of damage detrimental to performance.	EIA-364.10
Shielding effectiveness	One representative medium size StarShield™ backshell was fitted to a brass or copper fixture, wired with copper tubes and tested in accordance with VG95373-41. Shielding effectiveness was greater than 98 dB at 30 MHz and 90 dB at 100 MHz	VG95373-41

Consult factory for connector types not listed

Dimensions in inches (millimeters) and are subject to change without notice.

1) Application Equipment

Glenair recommends the use of a Bak Rion Model 5100726 1600W hot-air-gun with a 34mm sieve spoon reflector (or equivalent system). Clamp the hot-air-gun in a bench mounted vice or comparable fixture to stabilize, with the reflector nozzle pointed upwards.

Hot air gun settings

With the air-gun vent open and appropriate reflector nozzle installed, set the hot air gun as follows:

For installation of protective sleeves:

Use setting of 4-5 or 450° - 520°F (230° - 270°C)

For installation of the heat shrinkable terminator (HST):

Use setting of 8-9 or 720° - 790°F (380° - 420°C)

While the hot air gun is warming, take a moment to check that all necessary StarShield™ assembly equipment is ready to terminate, and that extra components are on hand in case of a mis-termination.

2) Cable Preparation

Single or multi-conductor shielded cables meeting the envelope dimensions below may be used in any combination not to exceed 4 braids per ferrule.

Figure 1

1) Refer to Figure 3 for Special Instructions

45° & 90° Circular 23	2.61
45° & 90° Circular 25	2.76
Straight Circular All Sizes	1.82

Fig. 1
45° Angular Function

Fig. 2
90° Angular Function

To calculate the cable length, see Table I (at left) to establish the *length constant* according to the connector designator's size and angular function. Then use the formula below to calculate the total length

$$45^\circ L = \text{Length constant} + D + E$$

Example:
470HT017XM176G
 $L = 2.03 + 0.81 + 1.20 = 4.04$ in.

$$\text{Straight } L = \text{Length constant} + \text{Straight length}$$

Example:
470HS017XM176G
 $L = 1.82 + 1.11 = 2.93$ in.

Dimensions in inches (millimeters) and are subject to change without notice.

HST preparation dimension

Adhesive Sleeve preparation dimension

1. D_1 Dimension allows for at least one repair of the crimp contact.
2. E_2 Dimension determined by crimp contact mfgs. instructions
3. F_3 Dimension for adhesive sleeve allows for at least on repair the the crimp contact

Figure 3

Heat Shrinkable Protective Sleeve

Please see section D of this Catalog for tool ordering information

Strip the cables according to the following dimensions.

Backshell Style	Size	D Dim $\pm .02''$ (0.5mm)	F Dim $\pm .02''$ (0.5mm)
Straight ARINC 600	All	3.23 (82)	2.83 (72)
Straight Circular	All	3.07 (78)	2.67 (68)
45° & 90° Circular	9	3.35 (85)	2.95 (75)
45° & 90° Circular	11 & 13	3.54 (90)	3.14 (80)
45° & 90° Circular	15 & 17	3.94 (100)	3.54 (90)
45° & 90° Circular	19	4.13 (105)	3.73 (95)
45° & 90° Circular	21	4.53 (115)	4.13 (105)
45° & 90° Circular	23	4.72 (120)	4.32 (110)
45° & 90° Circular	25	4.92 (125)	4.52 (115)

Make sure not to fray braided shielding ends. Contacts may be installed at this time if desired, provided their size is not so great as to prevent the leads to pass through the ferrule.

3) Assembly

Arrange prepared cables into bundles in accordance with plan. (See figure 1 in step 2)

For applications with 4 braids, we recommend the use of a solid tin plated copper wire $\text{Ø}008\text{-}016''$ (0.2-0.4mm) to bind the shields securely during the installation. Secure them together as shown in figure 3. Trim ends to .20" (5mm) long and fold flat along length of cable.

Using the hot air gun (see step 1), install provided .75" (19mm) protective sleeve directly adjacent the stripped braid. This will prevent the wire conductors from getting pinched in the ferrule slot as well as keeping the wire bundle well managed throughout the rest of the assembly process.

Dimensions in inches (millimeters) and are subject to change without notice.

Glenair StarShield™ Assembly Procedure

1 Stage the StarShield™ HST over the cable bundle, positioning the solder preform directly over the stripped section of braided shielding.

2 Next, carefully slide the StarShield™ ferrule (with slotted side oriented towards contacts) over the leads until the non-lipped end slides under the HST braid. Cable jacketing should be positioned on the ferrule as shown above.

4) Termination Procedure

Check that the hot-air-gun is set to the recommended setting and has been allowed to warm up for 1 minute.

Position cable and staged ferrule/HST in the center of the hot-air-gun reflector, being careful not to touch the outer heat shrink material to the reflector.

Dimensions in inches (millimeters) and are subject to change without notice.

A

Focus heat on ferrule for a few seconds and begin moving towards the solder preform. Solder should melt and begin to flow freely. Continue to move the preform towards the center of the heat reflector as solder completely melts and flows along preform braid.

Heat until shrink sleeve has fully recovered around preform assembly and solder has completely melted and flowed through copper braid (approximately 15-45 seconds). Some solder flowing over the stripped cable braids should be seen. The solder will take on a lustrous appearance when properly melted. (Note: luster will subside as preform assembly cools to ambient temperature).

Be careful not to overheat preform assembly and scorch outer shrink sleeve. Slight browning of outer shrink sleeve is acceptable, but severe discoloration is indicative of improper termination.

Please see section D of this Catalog for tool ordering information

5) Inspection

Allow the ferrule and HST assembly to cool completely before touching with bare hands.

Check for cuts, splits or charred spots in the outer heat shrink sleeve. A complete discolored dark brown sleeve indicates an overheated termination. A slight browning of the sleeve is acceptable.

Make sure that no braid strands are exposed from under the sleeve. If any such damage is evident, remove damaged sleeve and replace with new heat shrinkable sleeve Glenair part number 687-808-02 or 687-808-04.

If solder has not completely melted and flowed within the preform assembly and/or outer heat shrink sleeve has not fully recovered, reheating may be necessary.

6) Repair

Reheat incompletely melted terminations to obtain proper solder flow and/or fully recovered sleeve onto the cable jacket. If the outer shrink sleeve has split during the assembly process, it must be replaced. To do so, cut away existing (damaged) shrink sleeve with snips and carefully remove from solder preform. Slide replacement heat-shrinkable sleeve (Glenair P/N 687-808-**) over terminated solder preform, leaving roughly .06" (1.5mm) of overlap on the braid/ferrule transition point. Heat new shrink sleeve until it recovers fully around preform and wires, making sure to constantly move it within the hot air gun reflector to ensure even heating and recovery. Once the new shrink sleeve is fully recovered, remove assembly from the hot air gun and allow the assembly to cool before proceeding with subsequent steps. Repeat inspections per step 5.

Dimensions in inches (millimeters) and are subject to change without notice.

7) Replacement

A

In the case of severely damaged StarShield™ HST assemblies, complete removal and re-termination may be necessary. Users will need a hot air gun fixed in a bench mount (see step 1), needle nose pliers and an unused StarShield™ HST kit (Glenair part number 687-764-***)

Set hot-air-gun to recommended setting (see step 1) and allow to warm up for one minute.

Remove outer heat shrink sleeve completely, being careful not to cut or damage wire jacketing.

With needle nose pliers firmly planted on end of ferrule, place StarShield™ ferrule/HST in hot air gun and allow solder to melt and flow. Once solder is molten, gently pull ferrule away from braided preform and slide off wires. Remove assembly from heat and set aside.

Next, grasp preform braid with needle nose pliers and return assembly to hot air gun reflector. When solder begins to melt, gently pull preform braid away from cable. Remove from heat and allow to cool.

Once assembly cools to ambient temperature, use fingers to gently scrape residual solder off cable jacketing and protective sleeve.

Re-terminate with a new StarShield™ HST (Glenair part number 687-764-***) and inspect for damage per previous instructions.

Please see section D of this Catalog for tool ordering information

Dimensions in inches (millimeters) and are subject to change without notice.

8) Assembly of StarShield™ Backshells

Install HST/ferrules onto cables per steps 1 through 4.

❶ Terminate crimp contacts onto leads per Glenair crimping instructions, or follow appropriate connector manufacturer's contact procedure.

❷ Slide the gland nut, compression ring and backshell body/coupling nut assembly over the cable bundle—paying special attention to the order and orientation of each component.

❸ For backshells with drilled stars, route the wires that pass through the center hole of the star before inserting the contacts into the connector. See split star configurations in step 9 for further instruction.

A

Using appropriate insertion tools, insert terminated contacts into the connector per Glenair insertion instructions, or per connector manufacturer's procedure.

Please see section D of this Catalog for tool ordering information

Dimensions in inches (millimeters) and are subject to change without notice.

A

Hand tighten the backshell body/ coupling nut assembly onto the connector accessory threads until anti-rotation teeth engage. Once threads have engaged and anti-rotation teeth are sitting peak-to-valley, begin tightening with assembly tool to specified torque value. We suggest the connector be mated to an appropriate holding tool (see Glenair tools catalog) before final tightening takes place. Continue to tighten the coupling nut until specified torque value has been reached (see chart below for values). Effective EMI grounding is dependent upon proper tightening of backshell to connector body. Snap ferrules into place on the StarShield™ “star.”

Installation Torque Values for Circular Electrical Connector Accessories

Accessory Thread Torque: ± inch pounds

Shell Sizes	Group 1 Light & Medium Duty	Group 2 Heavy Duty	Group 2
	MIL-C-5015 (MS3100 Series) MIL-C-26482 Series I MIL-C-26500 MIL-C-27599 MIL-C-38999 Series I, II MIL-C-81511 Series I, II, III, IV MIL-C-81703 Series I	MIL-C-5015 (MS3400 Series) MIL-C-22992 MIL-C-26482 Series II MIL-C-28840 MIL-C-38999 Series III, IV MIL-C-81703 Series III MIL-C-83723 Series I, II, III	Values for Hand Held Tool Applications Field Repair Torque
8, 9, A	35	56	40 - 50
3, 10, 10SL, 11, B	35	76	40 - 50
7, 12, 12S, 13, C	40	108	40 - 50
14, 14S, 15, D	40	116	50 - 60
16, 16S, 17, E	40	116	50 - 60
18, 19, 27, F	40	116	50 - 60
20, 21, 37, G	80	136	80 - 90
22, 23, H	80	136	80 - 90
24, 25, 61, J	80	136	80 - 90

Notes:

Values based on 80% of MIL-C-85049 thread strength.
Use group 1 values for all composite connector accessories.
When tightened with Glenair
600-091 And 600-007 torque tools. Consult factory.

Dimensions in inches (millimeters) and are subject to change without notice.

9) Split Star Configurations

For star-in-star or split star configurations, install ferrules starting from the inner star or ferrule slot. Position conical ring on the star.

Position the sub-assemblies (stars, compression ring and ferrules) into the body by carefully twisting to “birdcage” the individual wire pairs first and then the entire wire bundle in a counter clockwise motion. If necessary, heat may be applied to the wires to make them more pliable and easier to fit into backshell body (Hot air gun setting 4–5 or 450°–520°F/230°–270°C with reducer nozzle).

Dimensions in inches (millimeters) and are subject to change without notice.

Glenair StarShield™ Assembly Procedure

Apply heat, then push and twist the wires until the gland nut threads engage the threads on the body.

A

Tighten the gland nut on the body to the appropriate torque value.

Dimensions in inches (millimeters) and are subject to change without notice.

Glenair recommends the use of an appropriately sized Series 600 backshell holding wrench, TG70 strap wrench, or TG69 soft jaw pliers. (These tools are used to grip the self-locking coupling nut. Any one of the three will do the job.) Connector plug or receptacle holder: These tools take the form of a socket device used in conjunction with a torque wrench, either hand held (600-161) or bench mounted (600-162). These tools are used to hold the inner body of the connector in place while the StarShield™ Backshell coupling nut and clamping nut are torqued onto the back. Note: most holder series tools provide "universal polarization", but a few connector series require specific polarization for each alternate keying arrangement. Please see section D of this Catalog for tool ordering information

10) Dismantling StarShield™ Backshells:

Dismantling is the reverse of the assembly. To remove a ferrule from a star, grip the ferrule assembly as close to the star as possible. Carefully twist and lift the ferrule straight up from the ferrule slot in the star. Do not remove the ferrule by lifting or pulling on the cable or wires only, or damage to the termination may result. For maximum contact extraction tool access, unclip all ferrules from the star, remove the star from the cable bundle before pushing the backshell body towards the cable.

Dimensions in inches (millimeters) and are subject to change without notice.

AmberStrand®

THE ULTRA-LIGHTWEIGHT MICROFILAMENT METAL CLAD EMI/ RFI COMPOSITE BRAIDING

MICROFILAMENT NICKEL CLAD
STAINLESS STEEL BRAID

- Metal-clad EMI/RFI Shielding with a lightweight composite thermoplastic base material
- Highly conductive surface plating
- Reduce shielding weight up to 80% and more
- Reduce operation costs by permanently reducing launch and aircraft all-up weights
- Superior high frequency shielding compared to tinned and/or nickel plated copper
- Exceptional tensile strength: 590,000 psi (min)

StarShield™ Backshell General Information

StarShield™ Zero Length Termination Backshells

EMI/RFI backshells with heat shrink termination (HST) sleeves provide superior shielding performance and effectiveness in shielded twisted pair cable applications.

Product Features

- The unique StarShield™ configuration completely eliminates “standing antenna” problems common with pigtail shield termination systems.
- The backshell utilizes familiar heat shrink termination (HST) sleeve technology for fast and reliable termination of shielding—even with dissimilar wire types and gauges.
- The internal configuration of the StarShield™ features a tapered split-ring that fits snugly into the conically machined backshell or a lightweight band-terminated compression system adapter.
- Available fittings include overbraid termination, conduit or shrink-boot adapters.
- Available for all standard MIL-AERO circular connector series, and many popular rectangular connector series.
- Environmental sealing, self-locking coupling nuts standard on StarShield™ backshells for select popular connector series
- Optional shrink boots also available.
- StarShield™ termination technology can be adapted to additional connector/backshell types not shown

38999 Series III and IV Connectors		
470-013	StarShield™ non-environmental, high ferrule count, EMI/RFI shield termination backshell with self-locking rotatable coupling nut	B-10
470-014	StarShield™ environmental EMI/RFI shield termination backshell with self-nestor rotatable coupling nut and rear end options	B-12
470-015	StarShield™ extended length, environmental, EMI/RFI backshell with self-locking rotatable coupling nut and shrink boot	B-14
470-017	StarShield™ composite, EMI/RFI shield termination backshell with self-locking rotatable coupling nut and shrink boot	B-16
470-019	StarShield™ split shell, high ferrule count, EMI/RFI shield termination backshell with self-locking rotatable coupling nut	B-18
470-020	StarShield™ split shell, non-environmental, EMI/RFI shield termination backshell with high ferrule count	B-20
477-004	StarShield™ environmental, extended length, EMI/RFI backshell with high ferrule count and self-nestor coupling	B-22
477-005	StarShield™ 90°, extended length, environmental, EMI/RFI shield termination backshell with self-nestor coupling	B-24
477-006	StarShield™ 30° environmental, high ferrule count, EMI/RFI shield termination backshell backshell with self-nestor coupling	B-26
477-007	StarShield™ environmental, extended length EMI/RFI shield termination backshell with self-nestor coupling	B-28
477-008	StarShield™ 30°, environmental, high ferrule count, EMI/RFI shield termination backshell with self-nestor coupling	B-30
477-009	StarShield™ environmental, EMI/RFI shield termination backshell with self-nestor and rear end options	B-32
800 Series Mighty Mouse connectors		
470-021	StarShield™ direct coupling, Mighty Mouse, EMI/RFI shield termination backshell with split banding porch	B-34
477-013	StarShield™ direct coupling, Mighty Mouse, EMI/RFI shield termination backshell with split banding porch	B-36
StarShield Backshells for Rectangular Connectors		
527-448	StarShield™ non environmental, EMI/RFI shield termination backshell assembly for size 2 ARINC 600	B-38
527-449	StarShield™ non-environmental, high ferrule count, EMI/RFI shield termination backshell assembly for size 2 ARINC 600	B-40
527-450	StarShield™ shield termination, EMI/RFI shield termination backshell with banding porch for Collins SGA3 connector	B-42
550-089	StarShield™ non-environmental shield termination backshell with cable entry and receptacle mounting options for D-Subminiature	B-44

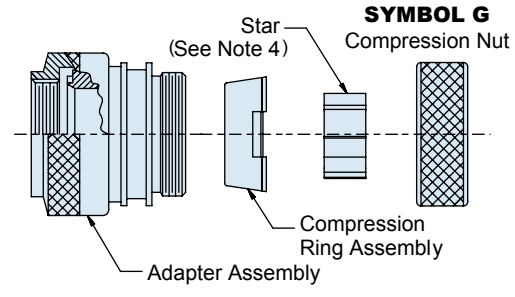

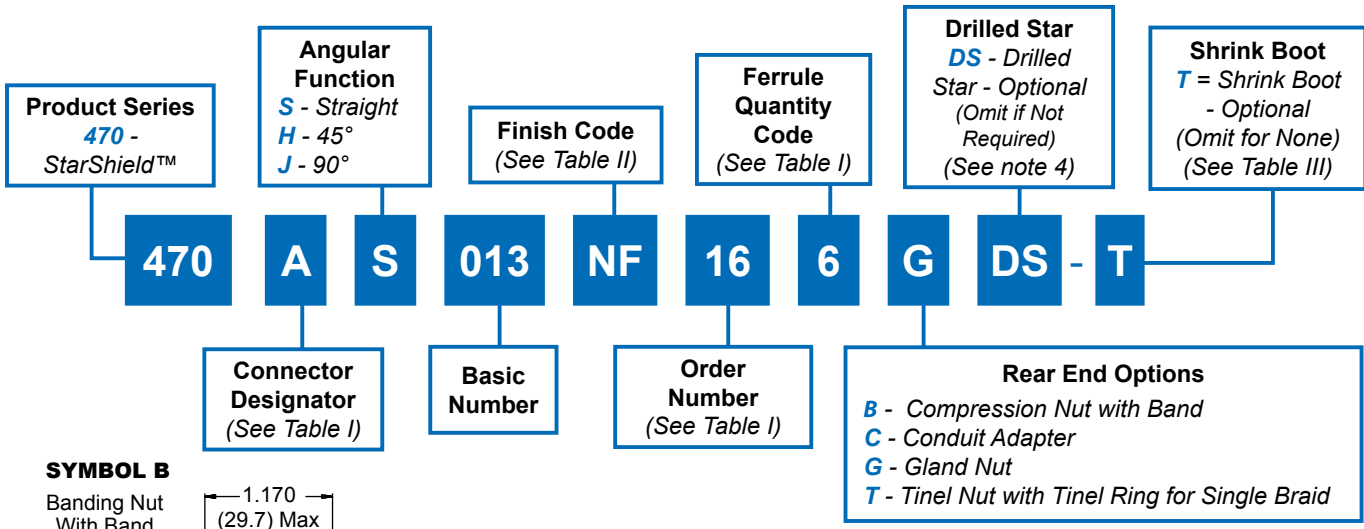

Dimensions in inches (millimeters) and are subject to change without notice.

470-013
StarShield™ EMI/RFI Shield Termination Backshell
for MIL-DTL-83723 Series I & III, 5015 MS400 Series, AS81703
Series 3, and MIL-C- 26482 Series 2

StarShield™ environmental backshell with self-nestor coupling and rear end options

Dimensions in inches (millimeters) and are subject to change without notice.

470-013
StarShield™ EMI/RFI Shield Termination Backshell
 for MIL-DTL-83723 Series I & III, 5015 MS400 Series, AS81703

Notes:

1. Assembly identified with manufacturer's name, part number and date code, space permitting.
2. For effective grounding, connector with conductive finish should be used.
3. Glenair 600 Series Backshell Assembly Tools are recommended for assembly and installation.
4. Star not supplied with Order Number 09. Drilled star is available on order numbers 15-25 only. If optional ferrule quantity per Table I is selected, one split and one solid star will be supplied.
5. Over-travel coupling design provides self-seating and self-locking functionality, eliminating lock-wire requirements.
6. Ferrule kit sold separately.
 687-764 ferrule and HST device kit
 687-809 ferrule and sealing device kit
 687-748 solder ferrule
 687-841-01 HST flex device

Material/Finish:	
Backshell, elbows, coupling and gland nut, compression ring and star	Aluminum alloy or CRES/Table III
Tinel ring	Nickel-titanium alloy/n.a.
Band	CRES/passivate

Table II: Material and Finish Options

Code	Material; Finish Description
M	Aluminum; electroless nickel
MT	Aluminum; nickel - PTFE
NF	Aluminum; CAD/O. D. over electroless nickel
ZN	Aluminum; zinc nickel/O. D. over electroless nickel
ZR	Aluminum; zinc nickel/black over electroless nickel (RoHS)
ZRC	Aluminum; zinc nickel over electroless nickel (RoHS)
Z1	Stainless steel; passivate
ZM	Stainless steel; electroless nickel

Material/Finish

Backshell, elbows, coupling and gland nut, compression ring and star	Aluminum alloy or CRES/Table II
Anti-decoupling device	Corrosion resistant material
O-ring	Silicone/n.a.
Tinel ring	Nickel-titanium alloy/n.a.
Band	CRES/passivate

Table III: Shrink Boot

Shell Size	Shrink Boot Part Number
09	770-001S1 04
11	770-001S1 06
13	770-001S1 06
15	770-001S1 07

Notes:

1. Assembly identified with manufacturer's name and P/N, space permitting.
2. For effective grounding, connector with conductive finish should be used.
3. Glenair 600 series backshell assembly tools are recommended for assembly and installation.
4. Star not supplied with order number 09. Drilled star is available on order numbers 15-25 only. If optional ferrule qty per Table I is selected, one split and one solid star will be supplied.
5. Over-travel coupling design provides self-seating & self-locking functionality eliminating lock-wire requirements.
6. Ferrule kit sold separately.
 687-764 ferrule and HST device kit
 687-809 ferrule and sealing device kit
 687-748 solder ferrule

STARSHIELD™ AND SWING ARM™ – A WINNING COMBINATION

FOR EMI/RFI PROTECTION AND FLEXIBLE CABLE ROUTING

StarShield™ dramatically reduces EMI/RFI distortion and maintains signal integrity by eliminating standing antennas created in the EMI shield termination process. Swing Arm™ is a revolutionary cable clamp and backshell design that allows multiple cable routing configurations in a single part. By marrying the shielding properties of StarShield™ to the versatility and ease-of-use of the Swing Arm™, Glenair delivers the ultimate in versatility and performance: Swing Arm™ reduces SKU's and complexity in cable harness design, and StarShield™ delivers unrivaled performance in EMI/RFI shield termination. And as always, Glenair delivers the premier customer service and technical support you depend on in a key supplier. Our engineering team is the best (and biggest) in the industry. And we offer same-day delivery on thousands of popular part numbers and unmatched capacity for volume production. For more information on Glenair "Out of this World Interconnect Solutions," please call or visit our factory, or see us online at www.glenair.com.

ARMORLITE™

THE SMART WAY TO REDUCE LAUNCH AND FLIGHT WEIGHTS MICROFILAMENT NICKEL CLAD STAINLESS STEEL BRAID

- Microfilament stainless steel: 70% lighter than NiCu A-A-59569
- Outstanding EMI/RFI shielding and conductivity
- Reduce shielding weight up to 70% and more
- Superior flexibility and "windowing resistance"

Glenair®

Series 77 Shrink Boots Lipped Straight Adapter Shrink Boots General Information

Lipped Straight Adapter Shrink Boots, Standard

StarShield™ Zero Length Shield Termination Backshells are equipped with boot grooves for the utilization of standard Glenair environmental lipped shrinkboots. After shrinking, the boot lip locks into the StarShield™ adapter groove. Eyelet hole allows attachment of dust caps or protective covers. Type 1 high performance elastomer boots for extreme temperatures and excellent resistance to fuels and oils, may be specified by adding a -T modifier to the StarShield™ part number. Choose boot size based on the tables provided on each StarShield™ catalog page.

- Easy attachment to StarShield™ backshell shrink boot adapters
- With or without eyelets

770-001S1 Type 1 High-Performance Elastomer Straight Lipped Adapter Shrink Boots, Standard

Supplemental Product Information

Type 1 High-Performance Elastomer Boots for Advanced Temperature and Chemical Tolerance

Semi-rigid high performance boots combine excellent resistance to fuels, oils and solvents with superior performance at extreme temperatures. Rated for 3000 hours continuous operation at +150° C, these boots fit most standard boot adapters for circular connectors. Material meets the requirements of VG95343 Type 6, BSG 198-5-DE, EN62329-102 and SAE AS5258 Type H. These boots are recommended for demanding applications such as military vehicles and petrochemical exploration. Boots come standard in black, see table below for optional colors.

- -75° C to +150° C
- Excellent resistance to fuels, oils, solvents and heat.
- Ten available colors

AmberStrand® Lightweight Composite Metal-Clad EMI/RFI Braided Shielding

AmberStrand®

AmberStrand® is ultra-lightweight microfilament metal clad EMI/RFI composite braiding

- Metal-clad EMI/RFI Shielding with a lightweight composite thermoplastic base material
- Highly conductive surface plating
- Reduce shielding weight up to 80% and more
- Reduce operation costs by permanently reducing launch and aircraft all-up weights
- Superior high frequency shielding compared to tinned and/or nickel plated copper
- Exceptional tensile strength: 590,000 psi (min)

AmberStrand®: The smart way to reduce launch and flight weights in aerospace systems

Glennair can also offer AmberStrand® users direct factory overbraiding services for both point-to-point as well as multi-branch interconnect assemblies.

Composite strain-relief backshell with integrated AmberStrand® lightweight composite metal-clad braid shield sock.

How does Amberstrand® compare, in terms of mechanical performance, to other materials?

**ArmorLite™ Microfilament Nickel Clad Stainless Steel
EMI/RFI Braided Shielding**

Supplemental
Product Information

ARMORLITE™

- Ultra-lightweight EMI/RFI braiding for high-temperature applications -80°C to +260°C
- Microfilament stainless steel: 70% lighter than NiCu A-A-59569
- Outstanding EMI/RFI shielding and conductivity
- Reduce shielding weight up to 70% and more
- Superior flexibility and "windowing" resistance: 90 to 95% optical coverage
- 220,000 psi (min) tensile strength
- Best performing metallic braid during lightning tests (Run to ANSI/EIA-364-75-1997 Waveform 5B)

Save weight and money every time you fly! Aircraft All-Up-Weight (AUW) has met its match: ArmorLite™ microfilament stainless steel braid saves pounds compared to standard QQ-B-575/A-A-59569 EMI/RFI shielding.

Choose user-installable microfilament tubular braid in twelve standard diameters Assemble per standard multi-branch cable shielding processes, as above.

Glenair can also offer ArmorLite™ users direct factory overbraiding services for both point-to-point as well as multi-branch assemblies.

Finishes

Finishes

Electroless Nickel

Cost	\$ \$ \$ \$ \$
Conductivity	+ + + + +
Corrosion Resistance	⌚ ⌚ ⌚ ⌚ ⌚
Operating Temperature	-65 to +200°C
Glenair Code	M

Aluminum plated with electroless nickel offers excellent conductivity, wear resistance, and adequate corrosion resistance. Typically specified on electrical connectors and accessories used in avionics boxes, exoatmospheric equipment, and missiles, electroless nickel is a good choice when exposure to marine or corrosive atmospheres is not a primary concern. The plating process is purely chemical, and once started, is autocatalytic (it runs by itself).

Stainless Steel

Cost	\$ \$ \$ \$ \$
Conductivity	+ + + + +
Corrosion Resistance	⌚ ⌚ ⌚ ⌚ ⌚
Operating Temperature	-65 to +200°C
Glenair Code	Z1, ZM

Stainless steel offers unbeatable strength and protection from environmental stress if durability and corrosion resistance are more important than cost and weight. Typically found on aircraft engines, landing gear, geophysical equipment, armored vehicles and marine applications, passivated stainless steel is widely specified throughout the interconnect industry. Also offered with nickel and cadmium plating for improved conductivity, stainless steel is an obvious alternative to cadmium if cost and weight are not an issue.

Zinc Nickel, Black

Cost	\$ \$ \$ \$ \$
Conductivity	+ + + + +
Corrosion Resistance	⌚ ⌚ ⌚ ⌚ ⌚
Operating Temperature	-65 to +175°C
Glenair Code	ZR

RoHS-compliant black zinc-nickel is approved for MIL-DTL-38999, AS85049 and other major military specifications as a replacement for cadmium and hexavalent chromium platings. The non-reflective finish and good conductivity make the Glenair ZR finish a leading choice for cadmium-free tactical systems. Corrosion resistance is comparable to cadmium, and the ZR finish is backward-compatible with cad-plated connectors and accessories.

Nickel-PTFE

Cost	\$ \$ \$ \$ \$
Conductivity	+ + + + +
Corrosion Resistance	⌚ ⌚ ⌚ ⌚ ⌚
Operating Temperature	-65 to +175°C
Glenair Code	MT

Now approved for MIL-DTL-38999 and MIL-DTL-83513, Glenair's 1000 Hour Grey™ meets the need for a cadmium replacement with excellent conductivity, wear resistance and corrosion protection. This extremely durable finish is gun-metal gray. A proprietary preliminary undercoat is followed with a composite coating of electroless nickel phosphorus and polytetra-fluoroethylene (PTFE). An organic topcoat provides sealing and added resistance to SO2 salt fog. Ni-PTFE is approved for the Joint Strike Fighter and offers extremely good lubricity.

Cadmium Olive Drab

Cost	\$ \$ \$ \$ \$
Conductivity	+ + + + +
Corrosion Resistance	⌚ ⌚ ⌚ ⌚ ⌚
Operating Temperature	-65 to +175°C
Glenair Code	NF

Cadmium plated aluminum has been the unchallenged workhorse of the defense/aerospace industry. Offering up to 1000 hours of salt spray protection when deposited over electroless nickel, cadmium is highly conductive, and provides good lubricity and resistance to galling. As plated, cadmium has a silvery appearance. A subsequent chromic acid passivation bath creates a chromate topcoat over the cadmium, enhancing corrosion protection. Olive drab chromate is widely used, followed by gold chromate and clear chromate.

Zinc-Nickel Olive Drab

Cost	\$ \$ \$ \$ \$
Conductivity	+ + + + +
Corrosion Resistance	⌚ ⌚ ⌚ ⌚ ⌚
Operating Temperature	-65 to +175°C
Glenair Code	ZN

Recently added to MIL-DTL-38999 and MIL-DTL-83513, zinc-nickel plated aluminum has become a cost-effective alternative to cadmium. Available with olive drab or black chromate conversion coatings, zinc-nickel plated aluminum is commonly found on soldier systems and military airframe applications.

Dimensions in inches (millimeters) and are subject to change without notice.

About Composite Materials

Supplemental
Product Information

- High temperature, high strength engineering composite thermoplastics for maximum strength and durability
- Total immunity to galvanic corrosion
- Up to 70% weight reduction compared to standard metal connectors and accessories
- Hundreds of innovative, tooled designs
- All popular part numbers in stock and ready for immediate, same-day shipment

Corrosion resistance, weight reduction, durability and design innovation

Glenair composite interconnect components are principally manufactured from 30% glass fiber polyetherimide (PEI), an amorphous thermoplastic with outstanding heat and chemical resistance and high strength. At room temperature the 30% glass filled PEI exhibits strength far beyond that of most engineering thermoplastics, with a tensile strength yield of over 15,000 psi. The PEI material meets all outgassing and flammability requirements.

Composite Thermoplastic Vs. Common Metal Materials			
Material	Specific Gravity	Density (lbs. Inch ³)	Salt Spray
Composite	1.27 - 1.51	.055	2000+ Hrs
Aluminum	2.55 - 2.80	.098	48-1000 Hrs

Back Shell Assembly Tools Band-Master™ ATS EMI/RFI Shield Termination Equipment

New Band-Master™
ATS Hand Banding
Tool

Now available with
built-in calibration counter

- Fast, cost-effective cable shielding termination
- Precision hand-held tool and bands deliver reliable, repeatable performance
- Single piece stainless steel bands in various sizes and lengths
- Clamp both small and large diameters easily and reliably
- Pneumatic banding tool for high-speed mass production
- Qualified for both military and commercial aviation

The Band-Master™ ATS provides quick, easy, cost-effective and highly reliable termination of braided metallic shielding or fabric braid to connectors and backshells.

The unique low profile and smooth inside diameter of the one-piece type 304 austenitic stainless steel clamping band virtually eliminates RFI/EMI/EMP leakage paths. The lock maintains constant tension under extreme environmental conditions. *Band-Master™ ATS* bands have passed severe shock, vibration and thermal cycle testing with negligible deterioration of shell conductivity.

Step One: Cable Prep

Lay individual shields over the band platform. Pull overall braid shield over the band platform so that all braid strands will be captured by the band.

Step Two: Install Band

Wrap the band through the buckle twice. Insert the free end into the banding tool in the direction shown on the tool. Squeeze the short grey handle to insert the band. Slide the band onto the cable. Close the black handle repeatedly until the handle no longer opens. Close the long grey handle until the tool cuts the band. Remove the excess band from the tool by closing the small grey handle.

Step Three: Trim Braid

It's a snap! Just trim the excess braid and you're done.
