## EL5108, EL5308

FN7358

## 450MHz Fixed Gain Amplifiers with Enable

The EL5108 and EL5308 are fixed gain amplifiers with a bandwidth of 450 MHz . This makes these amplifiers ideal for today's high speed video and monitor applications. They feature internal gain-setting resistors and can be configured in a gain of $+1,-1$ or +2 . The same bandwidth is seen in both gain-of-1 and gain-of-2 applications.

The EL5108 and EL5308 also incorporate an enable and disable function to reduce the supply current to $25 \mu \mathrm{~A}$ typical per amplifier. Allowing the $\overline{\mathrm{CE}}$ pin to float or applying a low logic level will enable the amplifier.

The EL5108 is offered in the 6 Ld SOT-23 and the industrystandard 8 Ld SOIC packages and the EL5308 is available in the 16 Ld SOIC and 16 Ld QSOP packages. All operate over the industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Features

- Pb-free available (RoHS compliant)
- Gain selectable (+1, $-1,+2$ )
- $450 \mathrm{MHz}-3 \mathrm{~dB}$ BW ( $\mathrm{A}_{\mathrm{V}}=-1,+1,+2$ )
- 3.5 mA supply current per amplifier
- Single and dual supply operation, from 5 V to 12 V
- Available in SOT-23 packages
- $350 \mathrm{MHz}, 1.5 \mathrm{~mA}$ product available (EL5106 and EL5306)

## Applications

- Battery powered equipment
- Handheld, portable devices
- Video amplifiers
- Cable drivers
- RGB amplifiers

*Please refer to TB347 for details on reel specifications.
NOTE: These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## Applications Information

## Product Description

The EL5108 and EL5308 are fixed gain amplifiers that offer a wide -3 dB bandwidth of 450 MHz and a low supply current of 3.5 mA per amplifier. They work with supply voltages ranging from a single 5 V to 10 V and they are also capable of swinging to within 1.2 V of either supply on the output. These combinations of high bandwidth, low power, and high slew rate make the EL5108 and EL5308 the ideal choice for many low-power/high-bandwidth applications such as portable, handheld, or battery-powered equipment.

For varying bandwidth and higher gains, consider the EL5166 with 1 GHz on a 9 mA supply current or the EL5164 with 600 MHz on a 3.5 mA supply current. Versions include single, dual, and triple amp packages with 6 Ld SOT-23,
16 Ld QSOP, and 8 Ld SOIC or 16 Ld SOIC outlines.

## Power Supply Bypassing and Printed Circuit Board Layout

As with any high frequency device, good printed circuit board layout is necessary for optimum performance. Low impedance ground plane construction is essential. Surface mount components are recommended, but if leaded components are used, lead lengths should be as short as possible. The power supply pins must be well bypassed to reduce the risk of oscillation. The combination of a $4.7 \mu \mathrm{~F}$ tantalum capacitor in parallel with a $0.01 \mu \mathrm{~F}$ capacitor has been shown to work well when placed at each supply pin.

## Disable/Power-Down

The EL5108 and EL5308 amplifiers can be disabled and placing their outputs in a high impedance state. When disabled, the amplifier supply current is reduced to $<25 \mu \mathrm{~A}$. The EL5108 and EL5308 are disabled when the $\overline{C E}$ pin is pulled up to within 1 V of the positive supply. Similarly, the amplifier is

FIGURE 20. PACKAGE POWER DISSIPATION vs AMBIENT TEMPERATURE
enabled by floating or pulling its $\overline{\mathrm{CE}}$ pin to at least 3 V below the positive supply. For $\pm 5 \mathrm{~V}$ supply, this means that the amplifier will be enabled when $\overline{\mathrm{CE}}$ is 2 V or less, and disabled when $\overline{\mathrm{CE}}$ is above 4 V . Although the logic levels are not standard TTL, this choice of logic voltages allow the EL5108 and EL5308 to be enabled by tying $\overline{\mathrm{CE}}$ to ground, even in 5 V single supply applications. The $\overline{\mathrm{CE}}$ pins can be driven from CMOS outputs.

## Gain Setting

The EL5108 and EL5308 are built with internal feedback and gain resistors. The internal feedback resistors have equal value; as a result, the amplifier can be configured into gain of $+1,-1$, and +2 without any external resistors. Figure 21 shows the amplifier in gain of +2 configuration. The gain error is $\pm 2 \%$ maximum. Figure 22 shows the amplifier in gain-of-1 configuration. For gain of $+1, \mathrm{IN}+$ and IN - should be connected together as shown in Figure 23. This configuration avoids the effects of any parasitic capacitance on the IN- pin. Since the internal feedback and gain resistors change with temperature and process, external resistor should not be used to adjust the gain settings.

FIGURE 21. $A_{V}=+2$

FIGURE 22. $A_{V}=-1$

FIGURE 23. $A_{V}=+1$

## Supply Voltage Range and Single-Supply Operation

The EL5108 and EL5308 have been designed to operate with supply voltages having a span of greater than or equal to 5 V and less than 12 V . In practical terms, this means that they will operate on dual supplies ranging from $\pm 2.5 \mathrm{~V}$ to $\pm 5 \mathrm{~V}$. With single-supply, they will operate from 5 V to 10 V .

As supply voltages continue to decrease, it becomes necessary to provide input and output voltage ranges that can get as close as possible to the supply voltages. The EL5108 and EL5308 have an input range which extends to within 2 V of either supply. So, for example, on $\pm 5 \mathrm{~V}$ supplies, the input range is about $\pm 3 \mathrm{~V}$. The output range is also quite large, extending to within 1 V of the supply rail. On a $\pm 5 \mathrm{~V}$ supply, the output is therefore capable of swinging from -4 V to +4 V . Single-supply output range is larger because of the increased negative swing due to the external pull-down resistor to ground. Figure 24 shows an AC-coupled, gain of $+2,+5 \mathrm{~V}$ single supply circuit configuration.

FIGURE 24.

## Video Performance

For good video performance, an amplifier is required to maintain the same output impedance and the same frequency response as DC levels are changed at the output. This is especially difficult when driving a standard video load of $150 \Omega$, because of the change in output current with DC level. Previously, good differential gain could only be achieved by running high idle currents through the output transistors (to reduce variations in output impedance). Special circuitry has been incorporated in the EL5108 and EL5308 to reduce the variation of output impedance with current output. This results in dG and dP specifications of $0.01 \%$ and $0.01^{\circ}$, while driving $150 \Omega$ at a gain of 2.

## Output Drive Capability

In spite of its low 3.5 mA of supply current per amplifier, the EL5108 and EL5308 are capable of providing a maximum of $\pm 130 \mathrm{~mA}$ of output current.

## Driving Cables and Capacitive Loads

When used as a cable driver, double termination is always recommended for reflection-free performance. For those applications, the back-termination series resistor will decouple the EL5108 and EL5308 from the cable and allow extensive capacitive drive. However, other applications may have high capacitive loads without a back-termination resistor. In these applications, a small series resistor (usually between $5 \Omega$ and $50 \Omega$ ) can be placed in series with the output to eliminate most peaking.

## Current Limiting

The EL5108 and EL5308 have no internal current-limiting circuitry. If the output is shorted, it is possible to exceed the Absolute Maximum Rating for output current or power dissipation, potentially resulting in the destruction of the device.

## Power Dissipation

With the high output drive capability of the EL5108 and EL5308, it is possible to exceed the $+125^{\circ} \mathrm{C}$ Absolute Maximum junction temperature under certain very high load current conditions. Generally speaking when $R_{L}$ falls below about $25 \Omega$, it is important to calculate the maximum junction temperature ( $T_{J M A X}$ ) for the application to determine if power supply voltages, load conditions, or package type need to be modified for the EL5108 and EL5308 to remain in the safe operating area. These parameters are calculated as follows:

$$
\mathrm{T}_{\mathrm{JMAX}}=\mathrm{T}_{\mathrm{MAX}}+\left(\theta_{\mathrm{JA}} \times \mathrm{n} \times \mathrm{PD}_{\mathrm{MAX}}\right)
$$

where:
$\mathrm{T}_{\text {MAX }}=$ Maximum ambient temperature
$\theta_{\mathrm{JA}}=$ Thermal resistance of the package
$\mathrm{n}=$ Number of amplifiers in the package
$\mathrm{PD}_{\text {MAX }}=$ Maximum power dissipation of each amplifier in the package
PD ${ }_{\text {MAX }}$ for each amplifier can be calculated as follows:

$$
\mathrm{PD}_{\mathrm{MAX}}=\left(2 \times \mathrm{V}_{\mathrm{S}} \times \mathrm{I}_{\mathrm{SMAX}}\right)+\left[\left(\mathrm{V}_{\mathrm{S}}-\mathrm{V}_{\text {OUTMAX }}\right) \times \frac{\mathrm{V}_{\text {OUTMAX }}}{R_{\mathrm{L}}}\right]
$$

where:
$\mathrm{V}_{\mathrm{S}}=$ Supply voltage
ISMAX $=$ Maximum supply current of 1 A
$\mathrm{V}_{\text {OUTMAX }}=$ Maximum output voltage (required)
$R_{L}=$ Load resistance
