

# White LED 1x/1.5x Charge Pump for Main and Sub-Displays

## General Description

The MAX1575 charge pump drives up to four white LEDs in the main display and up to two white LEDs in the sub-display with regulated constant current for uniform intensity. By utilizing adaptive 1x/1.5x charge-pump modes and very-low-dropout current regulators, it achieves high efficiency over the full 1-cell lithium-battery input voltage range. A 1MHz fixed-frequency switching allows for tiny external components, and the regulation scheme is optimized to ensure low EMI and low input ripple.

The MAX1575 uses an external resistor to set the full-scale 100% LED current. Two enable inputs, ENM and ENS, are used for simple on/off controls for the main and sub-displays, respectively. By repeatedly pulsing either enable input, the LEDs can be dimmed in multiple steps down to 5%. Once the desired brightness is set, the MAX1575 maintains that brightness setting as long as the enable input is kept high. If an enable input is kept low for more than 2ms, the LED current for the respective display is set to zero. If both enable inputs are kept low for more than 2ms, the MAX1575 enters shutdown.

The MAX1575 is available in a 16-pin 4mm x 4mm thin QFN package (0.8mm max height).

## Applications

Cell Phones with Main and Sub-Displays

PDAs/Smart Phones with Up to Six White LEDs

## Pin Configuration

## Features

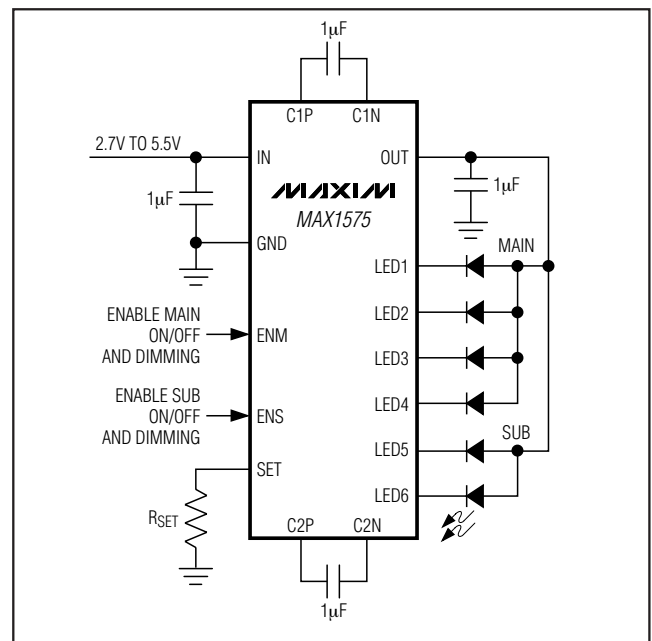

- ◆ Powers Main and Sub-Display LEDs
- ◆ 85% Average Efficiency (P<sub>LED</sub> / P<sub>BATT</sub>) Over Li+ Battery Discharge
- ◆ 2% LED Current Matching
- ◆ Up to 30mA/LED Drive Capability
- ◆ Adaptive 1x/1.5x Mode Switchover
- ◆ Low Input Ripple and EMI
- ◆ Individual 5% to 100% Dimming Through Single-Wire Serial Pulse Interface
- ◆ Low 0.1μA Shutdown Current
- ◆ 2.7V to 5.5V Supply Voltage Range
- ◆ Soft-Start Limits Inrush Current
- ◆ Output-Overvoltage Protection
- ◆ Thermal-Shutdown Protection
- ◆ 16-Pin Thin QFN 4mm x 4mm Package

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX1575ETE	-40°C to +85°C	16 Thin QFN 4mm x 4mm
MAX1575ETE+	-40°C to +85°C	16 Thin QFN 4mm x 4mm

+ Denotes lead-free package.

## Typical Operating Circuit

MAX1575

## Pin Description

PIN	NAME	FUNCTION
1	C2P	Transfer-Capacitor 2 Positive Connection. Connect a 1 $\mu$ F ceramic capacitor from C2P to C2N.
2	OUT	Output. Connect a 1 $\mu$ F ceramic capacitor from OUT to GND. Connect OUT to the anodes of all the LEDs. OUT is internally pulled down with 5k $\Omega$ during shutdown.
3	SET	Current-Set Input. Connect a resistor (R <sub>SET</sub> ) from SET to GND to set the maximum LED current. I <sub>LED(MAX)</sub> = 234 $\times$ 0.6V / R <sub>SET</sub> . SET is internally biased to 0.6V. SET is high impedance during shutdown.
4	ENS	Enable and Dimming Control for LED5 and LED6 (Sub-Display). The first time ENS goes high (50 $\mu$ s min), LED5 and LED6 turn on at 100% brightness. Pulsing ENS low dims the LEDs in multiple steps. If ENS is held low for more than 2ms (typ), LED5 and LED6 turn off. When ENM and ENS are both held low for more than 2ms (typ), the IC goes into shutdown mode. See Figure 1.
5	ENM	Enable and Dimming Control for LED1–LED4 (Main Display). The first time ENM goes high (50 $\mu$ s min), LED1–LED4 turn on at 100% brightness. Pulsing ENM low dims the LEDs in multiple steps. If ENM is held low for more than 2ms (typ), LED1–LED4 turn off. When ENM and ENS are both held low for more than 2ms (typ), the IC goes into shutdown mode. See Figure 1.
6	LED6	Sub-Display LEDs Cathode Connection. Current flowing into LED <sub>+</sub> is described in the ENS and SET descriptions above. The charge pump regulates the lowest-enabled LED <sub>+</sub> voltage to 180mV. Connect LED <sub>+</sub> to IN if the LED is not populated. LED <sub>+</sub> is high impedance during shutdown.
7	LED5	
8	LED4	
9	LED3	
10	LED2	
11	LED1	Main-Display LEDs Cathode Connection. Current flowing into LED <sub>+</sub> is described in the ENM and SET descriptions above. The charge pump regulates the lowest-enabled LED <sub>+</sub> voltage to 180mV. Connect LED <sub>+</sub> to IN if the LED is not populated. LED <sub>+</sub> is high impedance during shutdown.
12	GND	Ground. Connect GND as close as possible to system ground and to the ground of the input bypass capacitor.
13	C1N	Transfer-Capacitor 1 Negative Connection. Connect a 1 $\mu$ F ceramic capacitor from C1P to C1N.
14	IN	Supply Voltage Input. Connect a 1 $\mu$ F ceramic capacitor from IN to GND. The input voltage range is 2.7V to 5.5V. IN is high impedance during shutdown.
15	C2N	Transfer-Capacitor 2 Negative Connection. Connect a 1 $\mu$ F ceramic capacitor from C2P to C2N.
16	C1P	Transfer-Capacitor 1 Positive Connection. Connect a 1 $\mu$ F ceramic capacitor from C1P to C1N.
—	EP	Exposed Paddle. Connect the exposed paddle to GND.

## Detailed Description

The MAX1575 charge pump drives up to four white LEDs in the main display and up to two white LEDs in the sub-display with regulated constant current for uniform intensity. By utilizing adaptive 1x/1.5x charge-pump modes and very-low-dropout current regulators, it achieves high efficiency over the 1-cell lithium-battery input voltage range. 1MHz fixed-frequency switching allows for tiny external components and low input ripple.

### 1x to 1.5x Switchover

When V<sub>IN</sub> is higher than V<sub>OUT</sub>, the MAX1575 operates in 1x mode and V<sub>OUT</sub> is pulled up to V<sub>IN</sub>. The internal current regulators regulate the LED current. As V<sub>IN</sub> drops, V<sub>LED+</sub> eventually falls below the switchover threshold of 100mV and the MAX1575 starts switching in 1.5x mode.

When the input voltage rises above V<sub>OUT</sub> by about 50mV, the MAX1575 switches back to 1x mode.

### Soft-Start

The MAX1575 includes soft-start circuitry to limit inrush current at turn-on. When starting up, the output capacitor is charged directly from the input with a ramped current source (with no charge-pump action) until the output voltage approaches the input voltage. Once this occurs, the charge pump determines if 1x or 1.5x mode is required. In the case of 1x mode, the soft-start is terminated and normal operation begins. During the soft-start time, the output current is set to 5% of the maximum set by R<sub>SET</sub>. In the case of 1.5x mode, soft-start operates until the lowest of LED1–LED6 reaches regulation. If an overload condition occurs, soft-start repeats every 2ms. If the output is shorted to ground (or <1.25V), the part reverts to soft-start and the ramped current source.

# White LED 1x/1.5x Charge Pump for Main and Sub-Displays

## Setting the Output Current

The LED current at full (100%) brightness is set (up to 30mA) by a resistor,  $R_{SET}$ , as follows:

$$R_{SET} = \frac{0.6V \times 234}{I_{LED\_}}$$

## ENM and ENS Dimming Controls

When the LEDs are enabled by driving ENM or ENS high, the LED current initially goes to  $I_{LED\_}$ .

Dimming for the main display is done by pulsing ENM low (500ns to 500 $\mu$ s pulse width). Dimming for the sub-display is done by pulsing ENS low (500ns to 500 $\mu$ s pulse width). Each pulse reduces the LED current by 10%, so after one pulse the LED current is 0.9 x  $I_{LED\_}$ . The 10th pulse reduces the current by 5% so the LED current reduces from 0.1 x  $I_{LED\_}$  to 0.05 x  $I_{LED\_}$ . The 11th pulse sets the LED current back to  $I_{LED\_}$ . Figure 1 shows a timing diagram for EN<sub>+</sub>.

Because soft-start is longer than initial  $t_{HI}$ , apply dimming pulses quickly upon startup (after initial  $t_{HI}$ ) to avoid LED<sub>+</sub> current transitioning through full brightness. If dimming control is not required, EN<sub>+</sub> work as simple on/off controls. Drive ENM high to enable the main LEDs, or drive ENM low to turn off the main LEDs. Drive ENS high to enable the sub-LEDs, or drive ENS low to turn off the sub-LEDs. Drive both ENM and ENS low to put the IC in low-power shutdown mode.

## Shutdown Mode

When both ENM and ENS are held low for 2ms or longer, the MAX1575 is shut down and put in a low-current mode. OUT is internally pulled to GND with 5k $\Omega$  during shutdown.

## Overvoltage Protection

If any LED fails as an open circuit, the output voltage is limited to approximately 5V by gating on/off the charge pump. In case any LED<sub>+</sub> is floating or grounded, the MAX1575 operates in the same overvoltage-protection mode. To avoid overvoltage-protection mode when using fewer than six LEDs, connect any unused LED<sub>+</sub> to IN.

## Thermal Shutdown

The MAX1575 includes a thermal-limit circuit that shuts down the IC at approximately +160°C. The part turns on after the IC cools by approximately 20°C.

## Applications Information

### Driving Fewer than Six LEDs

When driving fewer than six LEDs, connect any unused LED<sub>+</sub> directly to IN (Figure 3). When connected in this manner, the corresponding LED driver is disabled.

### Input Ripple

For LED drivers, input ripple is more important than output ripple. Input ripple depends on the source supply's impedance. Adding a lowpass filter to the input further reduces input ripple. Alternately, increasing  $C_{IN}$  to 2.2 $\mu$ F cuts input ripple in half with only a small increase in footprint. The 1x mode always has very low input ripple.

NOTES:

- DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
- ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
- N IS THE TOTAL NUMBER OF TERMINALS.
- THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC 95-1 SPP-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.
- DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERMINAL TP.
- ND AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE RESPECTIVELY.
- DEPOPULATION IS POSSIBLE IN A SYMMETRICAL FASHION.
- COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
- DRAWING CONFORMS TO JEDEC M0220, EXCEPT FOR T2444-3, T2444-4 AND T2844-1.
- MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
- COPLANARITY SHALL NOT EXCEED 0.08mm
- WARPAGE SHALL NOT EXCEED 0.10mm
- LEAD CENTERLINES TO BE AT TRUE POSITION AS DEFINED BY BASIC DIMENSION "a", ±0.05.
- NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.

-DRAWING NOT TO SCALE-
