

8-bit ultra-low power microcontroller with up to 8 Kbytes Flash, multifunction timers, comparators, USART, SPI, I2C

Datasheet - production data

Features

- Main microcontroller features
 - Supply voltage range 1.65 V to 3.6 V
 - Low power consumption (Halt: 0.3 μ A, Active-halt: 0.8 μ A, Dynamic Run: 150 μ A/MHz)
 - STM8 Core with up to 16 CISC MIPS throughput
 - Temp. range: -40 to 85 $^{\circ}$ C and 125 $^{\circ}$ C
- Memories
 - Up to 8 Kbytes of Flash program including up to 2 Kbytes of data EEPROM
 - Error correction code (ECC)
 - Flexible write and read protection modes
 - In-application and in-circuit programming
 - Data EEPROM capability
 - 1.5 Kbytes of static RAM
- Clock management
 - Internal 16 MHz RC with fast wakeup time (typ. 4 μ s)
 - Internal low consumption 38 kHz RC driving both the IWDG and the AWU
- Reset and supply management
 - Ultra-low power POR/PDR
 - Three low-power modes: Wait, Active-halt, Halt
- Interrupt management
 - Nested interrupt controller with software priority control
 - Up to 29 external interrupt sources
- I/Os
 - Up to 30 I/Os, all mappable on external interrupt vectors
 - I/Os with programmable input pull-ups, high sink/source capability and one LED driver infrared output

- Peripherals
 - Two 16-bit general purpose timers (TIM2 and TIM3) with up and down counter and 2 channels (used as IC, OC, PWM)
 - One 8-bit timer (TIM4) with 7-bit prescaler
 - Infrared remote control (IR)
 - Independent watchdog
 - Auto-wakeup unit
 - Beeper timer with 1, 2 or 4 kHz frequencies
 - SPI synchronous serial interface
 - Fast I2C Multimaster/slave 400 kHz
 - USART with fractional baud rate generator
 - 2 comparators with 4 inputs each
- Development support
 - Hardware single wire interface module (SWIM) for fast on-chip programming and non intrusive debugging
 - In-circuit emulation (ICE)
- 96-bit unique ID

1 Introduction

This datasheet provides the STM8L101x1 STM8L101x2 STM8L101x3 pinout, ordering information, mechanical and electrical device characteristics.

For complete information on the STM8L101x1 STM8L101x2 STM8L101x3 microcontroller memory, registers and peripherals, please refer to the STM8L reference manual.

The STM8L101x1 STM8L101x2 STM8L101x3 devices are members of the STM8L low-power 8-bit family. They are

referred to as low-density devices in the STM8L101x1 STM8L101x2 STM8L101x3 microcontroller family reference manual (RM0013) and in the STM8L Flash programming manual (PM0054).

All devices of the SM8L product line provide the following benefits:

- Reduced system cost
 - Up to 8 Kbytes of low-density embedded Flash program memory including up to 2 Kbytes of data EEPROM
 - High system integration level with internal clock oscillators and watchdogs.
 - Smaller battery and cheaper power supplies.
- Low power consumption and advanced features
 - Up to 16 MIPS at 16 MHz CPU clock frequency
 - Less than 150 $\mu\text{A}/\text{MH}$, 0.8 μA in Active-halt mode, and 0.3 μA in Halt mode
 - Clock gated system and optimized power management
- Short development cycles
 - Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals.
 - Full documentation and a wide choice of development tools
- Product longevity
 - Advanced core and peripherals made in a state-of-the art technology
 - Product family operating from 1.65 V to 3.6 V supply.

2 Description

The STM8L101x1 STM8L101x2 STM8L101x3 low-power family features the enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low power operations.

The family includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive in-application debugging and ultrafast Flash programming.

All STM8L101xx microcontrollers feature low power low-voltage single-supply program Flash memory. The 8-Kbyte devices embed data EEPROM.

The STM8L101xx low power family is based on a generic set of state-of-the-art peripherals. The modular design of the peripheral set allows the same peripherals to be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, and simplified even more by the use of a common set of development tools.

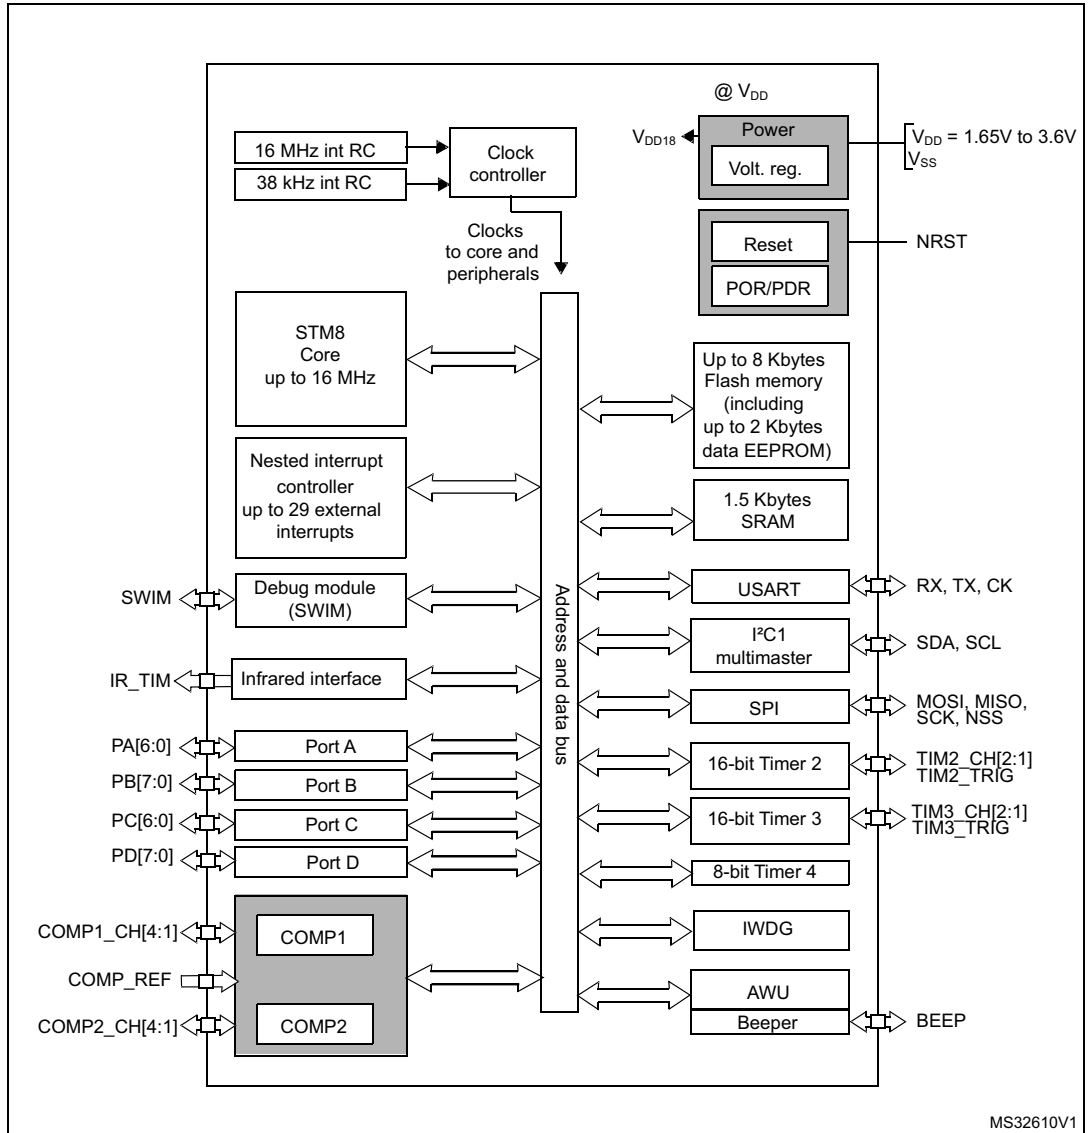

All STM8L low power products are based on the same architecture with the same memory mapping and a coherent pinout.

Table 2. STM8L101xx device feature summary

| Features | STM8L101xx | | |
|-----------------------|--|--|--|
| Flash | 2 Kbytes of Flash program memory | 4 Kbytes of Flash program memory | 8 Kbytes of Flash program memory including up to 2 Kbytes of Data EEPROM |
| RAM | 1.5 Kbytes | | |
| Peripheral functions | Independent watchdog (IWDG), Auto-wakeup unit (AWU), Beep, Serial peripheral interface (SPI), Inter-integrated circuit (I ² C), Universal synchronous / asynchronous receiver / transmitter (USART), 2 comparators, Infrared (IR) interface | | |
| Timers | Two 16-bit timers, one 8-bit timer | | |
| Operating voltage | 1.65 to 3.6 V | | |
| Operating temperature | -40 to +85 °C | | -40 to +85 °C or -40 to +125 °C |
| Packages | UFQFPN20 3x3 | UFQFPN28 4x 4 UFQFPN20 3x3 TSSOP20 4.4 x 6.4 | UFQFPN28 4x4 UFQFPN20 3x3 UFQFPN32 LQFP32 |

3 Product overview

Figure 1. STM8L101xx device block diagram

Legend:

- AWU: Auto-wakeup unit
- Int. RC: internal RC oscillator
- I²C: Inter-integrated circuit multimaster interface
- POR/PDR: Power on reset / power down reset
- SPI: Serial peripheral interface
- SWIM: Single wire interface module
- USART: Universal synchronous / asynchronous receiver / transmitter
- IWDG: Independent watchdog

3.1 Central processing unit STM8

The 8-bit STM8 core is designed for code efficiency and performance.

It features 21 internal registers, 20 addressing modes including indexed, indirect and relative addressing, and 80 instructions.

3.2 Development tools

Development tools for the STM8 microcontrollers include:

- The STice emulation system offering tracing and code profiling
- The STVD high-level language debugger including C compiler, assembler and integrated development environment
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

3.3 Single wire data interface (SWIM) and debug module

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The Single wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, also CPU operation can be monitored in real-time by means of shadow registers.

3.4 Interrupt controller

The STM8L101xx features a nested vectored interrupt controller:

- Nested interrupts with 3 software priority levels
- 26 interrupt vectors with hardware priority
- Up to 29 external interrupt sources on 10 vectors
- Trap and reset interrupts.

3.5 Memory

The STM8L101xx devices have the following main features:

- 1.5 Kbytes of RAM
- The EEPROM is divided into two memory arrays (see the STM8L reference manual for details on the memory mapping):
 - Up to 8 Kbytes of low-density embedded Flash program including up to 2 Kbytes of data EEPROM. Data EEPROM and Flash program areas can be write protected independently by using the memory access security mechanism (MASS).
 - 64 option bytes (one block) of which 5 bytes are already used for the device.

Error correction code is implemented on the EEPROM.

3.6 Low power modes

To minimize power consumption, the product features three low power modes:

- Wait mode: CPU clock stopped, selected peripherals at full clock speed.
- Active-halt mode: CPU and peripheral clocks are stopped. The programmable wakeup time is controlled by the AWU unit.
- Halt mode: CPU and peripheral clocks are stopped, the device remains powered on. The RAM content is preserved. Wakeup is triggered by an external interrupt.

3.7 Voltage regulators

The STM8L101xx embeds an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes: main voltage regulator mode (MVR) and low power voltage regulator mode (LPVR). When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

3.8 Clock control

The STM8L101xx embeds a robust clock controller. It is used to distribute the system clock to the core and the peripherals and to manage clock gating for low power modes. This system clock is a 16-MHz High Speed Internal RC oscillator (HSI RC), followed by a programmable prescaler.

In addition, a 38 kHz low speed internal RC oscillator is used by the independent watchdog (IWDG) and Auto-wakeup unit (AWU).

3.9 Independent watchdog

The independent watchdog (IWDG) peripheral can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the 38 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure.

3.10 Auto-wakeup counter

The auto-wakeup (AWU) counter is used to wakeup the device from Active-halt mode.

3.11 General purpose and basic timers

STM8L101xx devices contain two 16-bit general purpose timers (TIM2 and TIM3) and one 8-bit basic timer (TIM4).

16-bit general purpose timers

The 16-bit timers consist of 16-bit up/down auto-reload counters driven by a programmable prescaler. They perform a wide range of functions, including:

- Time base generation
- Measuring the pulse lengths of input signals (input capture)
- Generating output waveforms (output compare, PWM and One pulse mode)
- Interrupt capability on various events (capture, compare, overflow, break, trigger)

8-bit basic timer

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow.

3.12 Beeper

The STM8L101xx devices include a beeper function used to generate a beep signal in the range of 1, 2 or 4 kHz when the LSI clock is operating at a frequency of 38 kHz.

3.13 Infrared (IR) interface

The STM8L101xx devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

3.14 Comparators

The STM8L101xx features two zero-crossing comparators (COMP1 and COMP2) sharing the same current bias and voltage reference. The voltage reference can be internal (comparison with ground) or external (comparison to a reference pin voltage).

Each comparator is connected to 4 channels, which can be used to generate interrupt, timer input capture or timer break. Their polarity can be inverted.

3.15 USART

The USART interface (USART) allows full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

3.16 SPI

The serial peripheral interface (SPI) provides half/ full duplex synchronous serial communication with external devices. It can be configured as the master and in this case it provides the communication clock (SCK) to the external slave device. The interface can also operate in multi-master configuration.

3.17 I²C

The inter-integrated circuit (I2C) bus interface is designed to serve as an interface between the microcontroller and the serial I²C bus. It provides multi-master capability, and controls all I²C bus-specific sequencing, protocol, arbitration and timing. It manages standard and fast speed modes.

4 Pin description

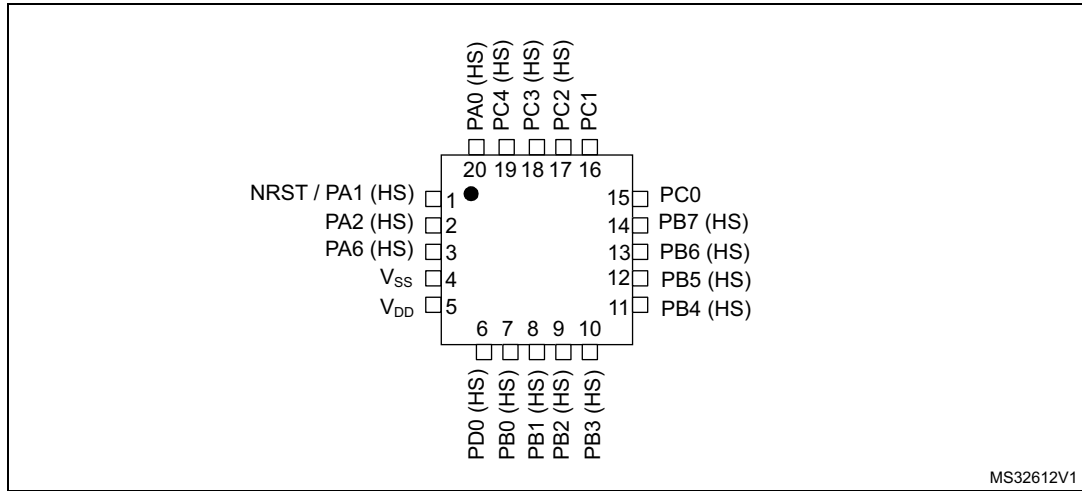

Figure 2. Standard 20-pin UFQFPN package pinout

1. HS corresponds to 20 mA high sink/source capability.
2. High sink LED driver capability available on PA0. Refer to the description of the IR_CR register in the STM8L reference manual (RM0013).

Note: *The COMP_REF pin is not available in this standard 20-pin UFQFPN package. It is available on Port A6 in the [Figure 3: 20-pin UFQFPN package pinout for STM8L101F1U6ATR, STM8L101F2U6ATR and STM8L101F3U6ATR part numbers.](#)*

Figure 3. 20-pin UFQFPN package pinout for STM8L101F1U6ATR, STM8L101F2U6ATR and STM8L101F3U6ATR part numbers

1. Please refer to the warning below.
2. HS corresponds to 20 mA high sink/source capability.
3. High sink LED driver capability available on PA0. Refer to the description of the IR_CR register in the STM8L reference manual (RM0013).

Warning: For the STM8L101F1U6ATR, STM8L101F2U6ATR and STM8L101F3U6ATR part numbers (devices with COMP_REF pin), all ports available on 32-pin packages must be considered as active ports. To avoid spurious effects, the user has to configure them as input pull-up. A small increase in consumption (typ. < 300 μ A) may occur during the power up and reset phase until these ports are properly configured.

Figure 4. 20-pin TSSOP package pinout

1. HS corresponds to 20 mA high sink/source capability.
2. High sink LED driver capability available on PA0. Refer to the description of the IR_CR register in the STM8L reference manual (RM0013).

Figure 5. Standard 28-pin UFQFPN package pinout

1. HS corresponds to 20 mA high sink/source capability.
2. High sink LED driver capability available on PA0. Refer to the description of the IR_CR register in the STM8L reference manual (RM0013).

Note: *The COMP_REF pin is not available in this standard 28-pin UFQFPN package. It is available on Port A6 in the [Figure 6: 28-pin UFQFPN package pinout for STM8L101G3U6ATR and STM8L101G2U6ATR part numbers.](#)*

Figure 6. 28-pin UFQFPN package pinout for STM8L101G3U6ATR and STM8L101G2U6ATR part numbers

1. HS corresponds to 20 mA high sink/source capability.
2. High sink LED driver capability available on PA0. Refer to the description of the IR_CR register in the STM8L reference manual (RM0013).

Warning: For the STM8L101G3U6ATR and STM8L101G2U6ATR part numbers (devices with COMP_REF pin), all ports available on 32-pin packages must be considered as active ports. To avoid spurious effects, the user has to configure them as input pull-up. A small increase in consumption (typ. < 300 μA) may occur during the power up and reset phase until these ports are properly configured.

Figure 7. 32-pin package pinout

1. Example given for the UFQFPN32 package. The pinout is the same for the LQFP32 package.
2. HS corresponds to 20 mA high sink/source capability.
3. High sink LED driver capability available on PA0. Refer to the description of the IR_CR register in the STM8L reference manual (RM0013).

Table 3. Legend/abbreviation for table 4

| | | |
|---------------------------------------|--|--|
| Type | I= input, O = output, S = power supply | |
| Level | Input | CM = CMOS |
| | Output | HS = high sink/source (20 mA) |
| Port and control configuration | Input | float = floating, wpu = weak pull-up |
| | Output | T = true open drain, OD = open drain, PP = push pull |
| Reset state | Bold X (pin state after reset release). Unless otherwise specified, the pin state is the same during the reset phase (i.e. "under reset") and after internal reset release (i.e. at reset state). | |

Table 4. STM8L101xx pin description

1. Please refer to the warning below.
2. At power-up, the PA1/NRST pin is a reset input pin with pull-up. To be used as a general purpose pin (PA1), it can be configured only as a general purpose pin (PA1), it can be configured only as output push-pull, not neither as output open-drain nor as a general purpose input. Refer to Section *Configuring NRST/PA1 pin as general purpose output* in the STM8L reference manual (RM0013).
3. A pull-up is applied to PB0 and PB4 during the reset phase. These two pins are input floating after reset release.
4. In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, weak pull-up and protection diode to V_{DD} are not implemented).
5. The PA0 pin is in input pull-up during the reset phase and after reset release.
6. High sink LED driver capability available on PA0.

Slope control of all GPIO pins can be programmed except true open drain pins and by default is limited to 2 MHz.

Warning: For the STM8L101F1U6ATR, STM8L101F2U6ATR, STM8L101F3U6ATR, STM8L101G2U6ATR and STM8L101G3U6ATR part numbers (devices with COMP_REF pin), all ports available on 32-pin packages must be considered as active ports. To avoid spurious effects, the user has to configure them as input pull-up. A small increase in consumption (typ. < 300 µA) may occur during the power up and reset phase until these ports are properly configured.

5 Memory and register map

Figure 8. Memory map

1. [Table 5](#) lists the boundary addresses for each memory size. The top of the stack is at the RAM end address.
2. Refer to [Table 7](#) for an overview of hardware register mapping, to [Table 6](#) for details on I/O port hardware registers, and to [Table 8](#) for information on CPU/SWIM/debug module controller registers.

Table 5. Flash and RAM boundary addresses

| Memory area | Size | Start address | End address |
|----------------------|------------|---------------|-------------|
| RAM | 1.5 Kbytes | 0x00 0000 | 0x00 05FF |
| Flash program memory | 2 Kbytes | 0x00 8000 | 0x00 87FF |
| | 4 Kbytes | 0x00 8000 | 0x00 8FFF |
| | 8 Kbytes | 0x00 8000 | 0x00 9FFF |

Note: 2 Kbytes of Data EEPROM is only available on devices with 8 Kbytes flash program memory.

Table 6. I/O Port hardware register map

| Address | Block | Register label | Register name | Reset status |
|-----------|--------|----------------|-----------------------------------|--------------|
| 0x00 5000 | Port A | PA_ODR | Port A data output latch register | 0x00 |
| 0x00 5001 | | PA_IDR | Port A input pin value register | 0xxx |

Table 9. Interrupt mapping (continued)

| IRQ No. | Source block | Description | Wakeup from Halt mode | Wakeup from Active-halt mode | Wakeup from Wait (WFI mode) | Wakeup from Wait (WFE mode) | Vector address |
|---------|--------------|--|-----------------------|------------------------------|-----------------------------|-----------------------------|----------------|
| 27 | USART | Transmission complete/transmit data register empty | - | - | Yes | Yes ⁽¹⁾ | 0x00 8074 |
| 28 | USART | Receive Register DATA FULL/overrun/idle line detected/parity error | - | - | Yes | Yes ⁽¹⁾ | 0x00 8078 |
| 29 | I2C | I2C interrupt ⁽²⁾ | Yes | Yes | Yes | Yes ⁽¹⁾ | 0x00 807C |

1. In WFE mode, this interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. Refer to Section *Wait for event (WFE) mode* in the RM0013 reference manual.
2. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated row of the memory.

All option bytes can be modified only in ICP mode (with SWIM) by accessing the EEPROM address. See [Table 10](#) for details on option byte addresses.

Refer to the STM8L Flash programming manual (PM0054) and STM8 SWIM and Debug Manual (UM0470) for information on SWIM programming procedures.

Table 10. Option bytes

| Addr. | Option name | Option byte No. | Option bits | | | | | | | | Factory default setting |
|--------|-----------------------------|-----------------|----------------------------|---|---|---|---|------------|----------|------|-------------------------|
| | | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| 0x4800 | Read-out protection (ROP) | OPT1 | ROP[7:0] | | | | | | | | 0x00 |
| 0x4807 | - | - | Must be programmed to 0x00 | | | | | | | | 0x00 |
| 0x4802 | UBC (User Boot code size) | OPT2 | UBC[7:0] | | | | | | | | 0x00 |
| 0x4803 | DATASIZE | OPT3 | DATASIZE[7:0] | | | | | | | | 0x00 |
| 0x4808 | Independent watchdog option | OPT4 [1:0] | Reserved | | | | | IWDG _HALT | IWDG _HW | 0x00 | |

Table 11. Option byte description

| | |
|------|---|
| OPT1 | <p>ROP[7:0] <i>Memory readout protection (ROP)</i></p> <p>0xAA: Enable readout protection (write access via SWIM protocol)</p> <p>Refer to Read-out protection section in the STM8L reference manual (RM0013) for details.</p> |
| OPT2 | <p>UBC[7:0] <i>Size of the user boot code area</i></p> <p>0x00: no UBC</p> <p>0x01-0x02: UBC contains only the interrupt vectors.</p> <p>0x03: Page 0 and 1 reserved for the interrupt vectors. Page 2 is available to store user boot code. Memory is write protected</p> <p>...</p> <p>0x7F - Page 0 to 126 reserved for UBC, memory is write protected</p> <p>Refer to User boot area (UBC) section in the STM8L reference manual (RM0013) for more details.</p> <p>UBC[7] is forced to 0 internally by HW.</p> |

Table 11. Option byte description (continued)

| | |
|-------------|--|
| <p>OPT3</p> | <p>DATASIZE[7:0] Size of the data EEPROM area 0x00: no data EEPROM area ⁽¹⁾ 0x01: 1 page reserved for data storage from 0x9FC0 to 0x9FFF⁽¹⁾ 0x02: 2 pages reserved for data storage from 0x9F80 to 0x9FFF⁽¹⁾ ... ⁽¹⁾ 0x20: 32 pages reserved for data storage from 0x9800 to 0x9FFF⁽¹⁾ Refer to Data EEPROM (DATA) section in the STM8L reference manual (RM0013) for more details. DATASIZE[7:6] are forced to 0 internal by HW.</p> |
| <p>OPT4</p> | <p>IWDG_HW: <i>Independent watchdog</i> 0: Independent watchdog activated by software 1: Independent watchdog activated by hardware</p> |
| | <p>IWDG_HALT: <i>Independent window watchdog reset on Halt/Active-halt</i> 0: Independent watchdog continues running in Halt/Active-halt mode 1: Independent watchdog stopped in Halt/Active-halt mode</p> |

1. 0x00 is the only allowed value for 4 Kbyte STM8L101xx devices.

Caution: After a device reset, read access to the program memory is not guaranteed if address 0x4807 is not programmed to 0x00.

8 Unique ID

STM8L101xx devices feature a 96-bit unique device identifier which provides a reference number that is unique for any device and in any context. The 96 bits of the identifier can never be altered by the user.

The unique device identifier can be read in single bytes and may then be concatenated using a custom algorithm.

The unique device identifier is ideally suited:

- For use as serial numbers
- For use as security keys to increase the code security in the program memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal memory
- To activate secure boot processes.

Table 12. Unique ID registers (96 bits)

| Address | Content description | Unique ID bits | | | | | | | |
|---------|----------------------------|----------------|---|---|---|---|---|---|---|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0x4925 | X co-ordinate on the wafer | U_ID[7:0] | | | | | | | |
| 0x4926 | | U_ID[15:8] | | | | | | | |
| 0x4927 | Y co-ordinate on the wafer | U_ID[23:16] | | | | | | | |
| 0x4928 | | U_ID[31:24] | | | | | | | |
| 0x4929 | Wafer number | U_ID[39:32] | | | | | | | |
| 0x492A | Lot number | U_ID[47:40] | | | | | | | |
| 0x492B | | U_ID[55:48] | | | | | | | |
| 0x492C | | U_ID[63:56] | | | | | | | |
| 0x492D | | U_ID[71:64] | | | | | | | |
| 0x492E | | U_ID[79:72] | | | | | | | |
| 0x492F | | U_ID[87:80] | | | | | | | |
| 0x4930 | | U_ID[95:88] | | | | | | | |

9 Electrical parameters

9.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS} .

9.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^\circ\text{C}$ and $T_A = T_A \text{ max}$ (given by the selected temperature range).

Note: The values given at $85\text{ }^\circ\text{C} < T_A \leq 125\text{ }^\circ\text{C}$ are only valid for suffix 3 versions.

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ($\text{mean} \pm 3\Sigma$).

9.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ }^\circ\text{C}$, $V_{DD} = 3\text{ V}$. They are given only as design guidelines and are not tested.

9.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

9.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 9](#).

Figure 9. Pin loading conditions

MS32617V1

9.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 10](#).

Figure 10. Pin input voltage

9.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 13: Voltage characteristics](#), [Table 14: Current characteristics](#) and [Table 15: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. The device mission profile is compliant with the JEDEC JESD47 qualification standard; extended mission profiles are available on demand.

Table 13. Voltage characteristics

| Symbol | Ratings | Min | Max | Unit |
|-------------------|--|--|----------------|------|
| $V_{DD} - V_{SS}$ | External supply voltage | -0.3 | 4.0 | V |
| V_{IN} | Input voltage on true open drain pins (PC0 and PC1) ⁽¹⁾ | $V_{SS} - 0.3$ | $V_{DD} + 4.0$ | |
| | Input voltage on any other pin ⁽²⁾ | $V_{SS} - 0.3$ | 4.0 | |
| V_{ESD} | Electrostatic discharge voltage | see Absolute maximum ratings (electrical sensitivity) on page 61 | | - |

1. Positive injection is not possible on these I/Os. V_{IN} maximum must always be respected. $I_{INJ(PIN)}$ must never be exceeded. A negative injection is induced by $V_{IN} < V_{SS}$.
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.

Table 14. Current characteristics

| Symbol | Ratings | Max. | Unit |
|-----------------------|--|------|------|
| I_{VDD} | Total current into V_{DD} power line (source) | 80 | mA |
| I_{VSS} | Total current out of V_{SS} ground line (sink) | 80 | |
| I_{IO} | Output current sunk by IR_TIM pin (with high sink LED driver capability) | 80 | |
| | Output current sunk by any other I/O and control pin | 25 | |
| | Output current sourced by any I/Os and control pin | -25 | |
| $I_{INJ(PIN)}$ | Injected current on true open-drain pins (PC0 and PC1) ⁽¹⁾ | -5 | |
| | Injected current on any other pin ⁽²⁾ | ±5 | |
| $\Sigma I_{INJ(PIN)}$ | Total injected current (sum of all I/O and control pins) ⁽³⁾ | ±25 | |

1. Positive injection is not possible on these I/Os. V_{IN} maximum must always be respected. $I_{INJ(PIN)}$ must never be exceeded. A negative injection is induced by $V_{IN} < V_{SS}$.
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.
3. When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

Table 15. Thermal characteristics

| Symbol | Ratings | Value | Unit |
|-----------|------------------------------|-------------|------|
| T_{STG} | Storage temperature range | -65 to +150 | °C |
| T_J | Maximum junction temperature | 150 | |

9.3 Operating conditions

Subject to general operating conditions for V_{DD} and T_A .

9.3.1 General operating conditions

Table 16. General operating conditions

| Symbol | Parameter | Conditions | Min | Max | Unit |
|--------------------|--|---|------|-----|------|
| $f_{MASTER}^{(1)}$ | Master clock frequency | $1.65\text{ V} \leq V_{DD} < 3.6\text{ V}$ | 2 | 16 | MHz |
| V_{DD} | Standard operating voltage | - | 1.65 | 3.6 | V |
| $P_D^{(2)}$ | Power dissipation at $T_A = 85\text{ °C}$ for suffix 6 devices | LQFP32 | - | 288 | mW |
| | | UFQFPN32 | - | 288 | |
| | | UFQFPN28 | - | 250 | |
| | | TSSOP20 | - | 181 | |
| | | UFQFPN20 | - | 196 | |
| | Power dissipation at $T_A = 125\text{ °C}$ for suffix 3 devices | LQFP32 | - | 83 | |
| | | UFQFPN32 | - | 185 | |
| | | UFQFPN28 | - | 62 | |
| | | TSSOP20 | - | 45 | |
| | | UFQFPN20 | - | 49 | |
| T_A | Temperature range | $1.65\text{ V} \leq V_{DD} < 3.6\text{ V}$ (6 suffix version) | -40 | 85 | °C |
| | | $1.65\text{ V} \leq V_{DD} < 3.6\text{ V}$ (3 suffix version) | -40 | 125 | |
| T_J | Junction temperature range | $-40\text{ °C} \leq T_A \leq 85\text{ °C}$ (6 suffix version) | -40 | 105 | °C |
| | | $-40\text{ °C} \leq T_A \leq 125\text{ °C}$ (3 suffix version) | -40 | 130 | °C |

1. $f_{MASTER} = f_{CPU}$

2. To calculate $P_{Dmax}(T_A)$ use the formula given in thermal characteristics $P_{Dmax} = (T_{Jmax} - T_A) / \Theta_{JA}$ with T_{Jmax} in this table and Θ_{JA} in table "Thermal characteristics"

9.3.2 Power-up / power-down operating conditions

Table 17. Operating conditions at power-up / power-down

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|--------------------|----------------------------|-----------------|------|-----|---------------------|-----------------|
| t_{VDD} | V_{DD} rise time rate | - | 20 | - | 1300 | $\mu\text{s/V}$ |
| t_{TEMP} | Reset release delay | V_{DD} rising | - | 1 | - | ms |
| $V_{POR}^{(1)(2)}$ | Power on reset threshold | - | 1.35 | - | 1.65 ⁽³⁾ | V |
| $V_{PDR}^{(1)(2)}$ | Power down reset threshold | - | 1.40 | - | 1.60 | V |

1. Guaranteed by characterization results.
2. Correct device reset during power on sequence is guaranteed when $t_{VDD[\text{max}]}$ is respected. External reset circuit is recommended to ensure correct device reset during power down, when $V_{PDR} < V_{DD} < V_{DD[\text{min}]}$.
3. Tested in production.

9.3.3 Supply current characteristics

Total current consumption

The MCU is placed under the following conditions:

- All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)
- All peripherals are disabled except if explicitly mentioned.

Subject to general operating conditions for V_{DD} and T_A .

Table 18. Total current consumption in Run mode ⁽¹⁾

| Symbol | Parameter | Conditions ⁽²⁾ | | Typ | Max ⁽³⁾ | Unit |
|-----------------------|---|---------------------------|------------------------------|------|---------------------|------|
| I _{DD (Run)} | Supply current in Run mode ^{(4) (5)} | Code executed from RAM | f _{MASTER} = 2 MHz | 0.39 | 0.60 | mA |
| | | | f _{MASTER} = 4 MHz | 0.55 | 0.70 | |
| | | | f _{MASTER} = 8 MHz | 0.90 | 1.20 | |
| | | | f _{MASTER} = 16 MHz | 1.60 | 2.10 ⁽⁶⁾ | |
| | | Code executed from Flash | f _{MASTER} = 2 MHz | 0.55 | 0.70 | |
| | | | f _{MASTER} = 4 MHz | 0.88 | 1.80 | |
| | | | f _{MASTER} = 8 MHz | 1.50 | 2.50 | |
| | | | f _{MASTER} = 16 MHz | 2.70 | 3.50 | |

- Based on characterization results, unless otherwise specified.
- All peripherals off, V_{DD} from 1.65 V to 3.6 V, HSI internal RC osc., f_{CPU}=f_{MASTER}
- Maximum values are given for T_A = -40 to 125 °C.
- CPU executing typical data processing.
- An approximate value of I_{DD(Run)} can be given by the following formula:
 $I_{DD(Run)} = f_{MASTER} \times 150 \mu A/MHz + 215 \mu A.$
- Tested in production.

- Typical current consumption measured with code executed from Flash.

Table 19. Total current consumption in Wait mode⁽¹⁾

| Symbol | Parameter | Conditions | | Typ | Max ⁽²⁾ | Unit |
|------------------------|-----------------------------|--|------------------------------|-----|--------------------|------|
| I _{DD (Wait)} | Supply current in Wait mode | CPU not clocked, all peripherals off, HSI internal RC osc. | f _{MASTER} = 2 MHz | 245 | 400 | μA |
| | | | f _{MASTER} = 4 MHz | 300 | 450 | |
| | | | f _{MASTER} = 8 MHz | 380 | 600 | |
| | | | f _{MASTER} = 16 MHz | 510 | 800 | |

1. Based on characterization results, unless otherwise specified.
2. Maximum values are given for T_A = -40 to 125 °C.

1. Typical current consumption measured with code executed from Flash.

Table 20. Total current consumption and timing in Halt and Active-halt mode at $V_{DD} = 1.65\text{ V to }3.6\text{ V}^{(1)(2)}$

| Symbol | Parameter | Conditions | Typ | Max | Unit | |
|----------------------|---|---------------------------------------|---------------------------------------|--------------------|---------------|---------------|
| $I_{DD(AH)}$ | Supply current in Active-halt mode | LSI RC osc. (at 37 kHz) | $T_A = -40\text{ °C to }25\text{ °C}$ | 0.8 | 2 | μA |
| | | | $T_A = 55\text{ °C}$ | 1 | 2.5 | μA |
| | | | $T_A = 85\text{ °C}$ | 1.4 | 3.2 | μA |
| | | | $T_A = 105\text{ °C}$ | 2.9 | 7.5 | μA |
| | | | $T_A = 125\text{ °C}$ | 5.8 | 13 | μA |
| $I_{DD(WUFAH)}$ | Supply current during wakeup time from Active-halt mode | - | - | 2 | - | mA |
| $t_{WU(AH)}^{(3)}$ | Wakeup time from Active-halt mode to Run mode | $f_{CPU} = 16\text{ MHz}$ | 4 | 6.5 | μs | |
| $I_{DD(Halt)}$ | Supply current in Halt mode | $T_A = -40\text{ °C to }25\text{ °C}$ | 0.35 | 1.2 ⁽⁴⁾ | μA | |
| | | $T_A = 55\text{ °C}$ | 0.6 | 1.8 | μA | |
| | | $T_A = 85\text{ °C}$ | 1 | 2.5 ⁽⁴⁾ | μA | |
| | | $T_A = 105\text{ °C}$ | 2.5 | 6.5 | μA | |
| | | $T_A = 125\text{ °C}$ | 5.4 | 12 ⁽⁴⁾ | μA | |
| $I_{DD(WUFH)}$ | Supply current during wakeup time from Halt mode | - | - | 2 | - | mA |
| $t_{WU(Halt)}^{(3)}$ | Wakeup time from Halt mode to Run mode | $f_{CPU} = 16\text{ MHz}$ | 4 | 6.5 | μs | |

- $T_A = -40\text{ to }125\text{ °C}$, no floating I/O, unless otherwise specified.
- Guaranteed by characterization results.
- Measured from interrupt event to interrupt vector fetch.
To get t_{WU} for another CPU frequency use $t_{WU}(FREQ) = t_{WU}(16\text{ MHz}) + 1.5 (T_{FREQ} - T_{16\text{ MHz}})$.
The first word of interrupt routine is fetched 5 CPU cycles after t_{WU} .
- Tested in production.

Figure 15. Typ. $I_{DD(Halt)}$ vs. V_{DD} , $f_{CPU} = 2\text{ MHz}$ and 16 MHz

- Typical current consumption measured with code executed from Flash.

Current consumption of on-chip peripherals

Measurement made for $f_{MASTER} =$ from 2 MHz to 16 MHz

Table 21. Peripheral current consumption

| Symbol | Parameter | Typ. $V_{DD} = 3.0 V$ | Unit |
|-----------------|--|-----------------------|--------|
| $I_{DD(TIM2)}$ | TIM2 supply current ⁽¹⁾ | 9 | μA/MHz |
| $I_{DD(TIM3)}$ | TIM3 supply current ⁽¹⁾ | 9 | |
| $I_{DD(TIM4)}$ | TIM4 timer supply current ⁽¹⁾ | 4 | |
| $I_{DD(USART)}$ | USART supply current ⁽²⁾ | 7 | |
| $I_{DD(SPI)}$ | SPI supply current ⁽²⁾ | 4 | |
| $I_{DD(I^2C1)}$ | I2C supply current ⁽²⁾ | 4 | |
| $I_{DD(COMP)}$ | Comparator supply current ⁽²⁾ | 20 | μA |

1. Data based on a differential I_{DD} measurement between all peripherals off and a timer counter running at 16 MHz. The CPU is in Wait mode in both cases. No IC/OC programmed, no I/O pin toggling. Not tested in production.
2. Data based on a differential I_{DD} measurement between the on-chip peripheral when kept under reset and not clocked and the on-chip peripheral when clocked and not kept under reset. The CPU is in Wait mode in both cases. No I/O pin toggling. Not tested in production.

9.3.4 Clock and timing characteristics

Internal clock sources

Subject to general operating conditions for V_{DD} and T_A .

High speed internal RC oscillator (HSI)

Table 22. HSI oscillator characteristics ⁽¹⁾

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---------------|---|--|---------------------|-----|--------------------|------|
| f_{HSI} | Frequency | $V_{DD} = 3.0 V$ | - | 16 | - | MHz |
| ACC_{HSI} | Accuracy of HSI oscillator (factory calibrated) | $V_{DD} = 3.0 V, T_A = 25\text{ }^\circ\text{C}$ | -1 | - | 1 | % |
| | | $V_{DD} = 3.0 V, -10\text{ }^\circ\text{C} \leq T_A \leq 85\text{ }^\circ\text{C}$ | -2.5 ⁽²⁾ | - | 2 ⁽²⁾ | % |
| | | $V_{DD} = 3.0 V, -10\text{ }^\circ\text{C} \leq T_A \leq 125\text{ }^\circ\text{C}$ | -4.5 ⁽²⁾ | - | 2 ⁽²⁾ | % |
| | | $V_{DD} = 3.0 V, 0\text{ }^\circ\text{C} \leq T_A \leq 55\text{ }^\circ\text{C}$ | -1.5 ⁽²⁾ | - | 1.5 ⁽²⁾ | % |
| | | $V_{DD} = 3.0 V, -10\text{ }^\circ\text{C} \leq T_A \leq 70\text{ }^\circ\text{C}$ | -2 ⁽²⁾ | - | 2 ⁽²⁾ | % |
| | | $1.65 V \leq V_{DD} \leq 3.6 V, -40\text{ }^\circ\text{C} \leq T_A \leq 125\text{ }^\circ\text{C}$ | -4.5 ⁽²⁾ | - | 3 ⁽²⁾ | % |
| $I_{DD(HSI)}$ | HSI oscillator power consumption | - | - | 70 | 100 ⁽²⁾ | μA |

1. $V_{DD} = 3.0 V, T_A = -40$ to $125\text{ }^\circ\text{C}$ unless otherwise specified.
2. Guaranteed by characterization results.

Figure 16. Typical HSI frequency vs. V_{DD}

Figure 17. Typical HSI accuracy vs. temperature, $V_{DD} = 3\text{ V}$

Figure 18. Typical HSI accuracy vs. temperature, $V_{DD} = 1.65\text{ V to }3.6\text{ V}$

Low speed internal RC oscillator (LSI)

Table 23. LSI oscillator characteristics (1)

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------|-----------------------------------|--|-----|-----|-----|------|
| f_{LSI} | Frequency | - | 26 | 38 | 56 | kHz |
| $f_{drift(LSI)}$ | LSI oscillator frequency drift(2) | $0\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ | -12 | - | 11 | % |

- $V_{DD} = 1.65\text{ V}$ to 3.6 V , $T_A = -40$ to $125\text{ }^{\circ}\text{C}$ unless otherwise specified.
- For each individual part, this value is the frequency drift from the initial measured frequency.

Figure 19. Typical LSI RC frequency vs. V_{DD}

9.3.5 Memory characteristics

$T_A = -40$ to $125\text{ }^{\circ}\text{C}$ unless otherwise specified.

Table 24. RAM and hardware registers

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|----------|-------------------------|----------------------|-----|-----|-----|------|
| V_{RM} | Data retention mode (1) | Halt mode (or Reset) | 1.4 | - | - | V |

- Minimum supply voltage without losing data stored in RAM (in Halt mode or under Reset) or in hardware registers (only in Halt mode). Guaranteed by characterization results.

Flash memory

Table 25. Flash program memory

| Symbol | Parameter | Conditions | Min | Typ | Max (1) | Unit |
|------------|--|------------------------------|------|-----|---------|------|
| V_{DD} | Operating voltage (all modes, read/write/erase) | $f_{MASTER} = 16\text{ MHz}$ | 1.65 | - | 3.6 | V |
| t_{prog} | Programming time for 1- or 64-byte (block) erase/write cycles (on programmed byte) | - | - | 6 | - | ms |
| | Programming time for 1- to 64-byte (block) write cycles (on erased byte) | - | - | 3 | - | ms |

Table 25. Flash program memory (continued)

| Symbol | Parameter | Conditions | Min | Typ | Max (1) | Unit |
|-------------------|---|---|-----------------------|-----|---------|---------|
| I _{prog} | Programming/ erasing consumption | T _A =+25 °C, V _{DD} = 3.0 V | - | 0.7 | - | mA |
| | | T _A =+25 °C, V _{DD} = 1.8 V | - | | - | |
| t _{RET} | Data retention (program memory) after 10k erase/write cycles at T _A = +85 °C | T _{RET} = 55 °C | 20 ⁽¹⁾ | - | - | years |
| | Data retention (data memory) after 10k erase/write cycles at T _A = +85 °C | T _{RET} = 55 °C | 20 ⁽¹⁾ | - | - | |
| | Data retention (data memory) after 300k erase/write cycles at T _A = +125 °C | T _{RET} = 85 °C | 1 ⁽¹⁾ | - | - | |
| N _{RW} | Erase/write cycles (program memory) | See notes (1)(2) | 10 ⁽¹⁾ | - | - | kcycles |
| | Erase/write cycles (data memory) | See notes (1)(3) | 300 ⁽¹⁾⁽⁴⁾ | - | - | |

1. Guaranteed by characterization results.
2. Retention guaranteed after cycling is 10 years at 55 °C.
3. Retention guaranteed after cycling is 1 year at 55 °C.
4. Data based on characterization performed on the whole data memory (2 Kbytes).

9.3.6 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 26. I/O static characteristics (1)

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------|--|---|------------------------|-----|-----------------------|------|
| V _{IL} | Input low level voltage ⁽²⁾ | Standard I/Os | V _{SS} -0.3 | - | 0.3 x V _{DD} | V |
| | | True open drain I/Os | V _{SS} -0.3 | - | 0.3 x V _{DD} | |
| V _{IH} | Input high level voltage (2) | Standard I/Os | 0.70 x V _{DD} | - | V _{DD} +0.3 | V |
| | | True open drain I/Os V _{DD} < 2 V | 0.70 x V _{DD} | - | 5.2 | |
| | | True open drain I/Os V _{DD} ≥ 2 V | | - | 5.5 | |
| V _{hys} | Schmitt trigger voltage hysteresis (3) | Standard I/Os | - | 200 | - | mV |
| | | True open drain I/Os | - | 250 | - | |

Table 26. I/O static characteristics ⁽¹⁾ (continued)

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|--------------------------------|---|---|-----|-----|--------------------|------|
| I _{lkg} | Input leakage current ⁽⁴⁾ | V _{SS} ≤ V _{IN} ≤ V _{DD} Standard I/Os | - | - | 50 ⁽⁵⁾ | nA |
| | | V _{SS} ≤ V _{IN} ≤ V _{DD} True open drain I/Os | - | - | 200 ⁽⁵⁾ | |
| | | V _{SS} ≤ V _{IN} ≤ V _{DD} PA0 with high sink LED driver capability | - | - | 200 ⁽⁵⁾ | |
| R _{PU} | Weak pull-up equivalent resistor ⁽⁶⁾ | V _{IN} = V _{SS} | 30 | 45 | 60 | kΩ |
| C _{IO} ⁽⁷⁾ | I/O pin capacitance | - | - | 5 | - | pF |

- V_{DD} = 3.0 V, T_A = -40 to 85 °C unless otherwise specified.
- Guaranteed by characterization results.
- Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested.
- The max. value may be exceeded if negative current is injected on adjacent pins.
- Not tested in production.
- R_{PU} pull-up equivalent resistor based on a resistive transistor (corresponding I_{PU} current characteristics described in [Figure 22](#)).
- Guaranteed by design.

Figure 20. Typical V_{IL} and V_{IH} vs. V_{DD} (High sink I/Os)

Figure 21. Typical V_{IL} and V_{IH} vs. V_{DD} (true open drain I/Os)

Figure 22. Typical pull-up resistance R_{PU} vs. V_{DD} with $V_{IN}=V_{SS}$

Figure 23. Typical pull-up current I_{PU} vs. V_{DD} with $V_{IN}=V_{SS}$

Output driving current

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 27. Output driving current (High sink ports)

| I/O Type | Symbol | Parameter | Conditions | Min | Max | Unit |
|----------|----------------|--|---|---------------|------|------|
| Standard | $V_{OL}^{(1)}$ | Output low level voltage for an I/O pin | $I_{IO} = +2 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$ | - | 0.45 | V |
| | | | $I_{IO} = +2 \text{ mA}$, $V_{DD} = 1.8 \text{ V}$ | - | 0.45 | V |
| | | | $I_{IO} = +10 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$ | - | 1.2 | V |
| | $V_{OH}^{(2)}$ | Output high level voltage for an I/O pin | $I_{IO} = -2 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$ | $V_{DD}-0.45$ | - | V |
| | | | $I_{IO} = -1 \text{ mA}$, $V_{DD} = 1.8 \text{ V}$ | $V_{DD}-0.45$ | - | V |
| | | | $I_{IO} = -10 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$ | $V_{DD}-1.2$ | - | V |

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in [Table 14](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .
2. The I_{IO} current sourced must always respect the absolute maximum rating specified in [Table 14](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VDD} .

Table 28. Output driving current (true open drain ports)

| I/O Type | Symbol | Parameter | Conditions | Min | Max | Unit |
|------------|----------------|---|--|-----|------|------|
| Open drain | $V_{OL}^{(1)}$ | Output low level voltage for an I/O pin | $I_{IO} = +3 \text{ mA}$, $V_{DD} = 3.0 \text{ V}$ | - | 0.45 | V |
| | | | $I_{IO} = +1 \text{ mA}$, $V_{DD} = 1.8 \text{ V}$ | - | 0.45 | V |

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in [Table 14](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .

Table 29. Output driving current (PA0 with high sink LED driver capability)

| I/O Type | Symbol | Parameter | Conditions | Min | Max | Unit |
|----------|----------------|---|---|-----|-----|------|
| IR | $V_{OL}^{(1)}$ | Output low level voltage for an I/O pin | $I_{IO} = +20 \text{ mA}$, $V_{DD} = 2.0 \text{ V}$ | - | 0.9 | V |

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in [Table 14](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .

Figure 24. Typ. V_{OL} at $V_{DD} = 3.0\text{ V}$ (High sink ports)

Figure 26. Typ. V_{OL} at $V_{DD} = 3.0\text{ V}$ (true open drain ports)

Figure 27. Typ. V_{OL} at $V_{DD} = 1.8\text{ V}$ (true open drain ports)

Figure 28. Typ. $V_{DD} - V_{OH}$ at $V_{DD} = 3.0\text{ V}$ (High sink ports)

Figure 29. Typ. $V_{DD} - V_{OH}$ at $V_{DD} = 1.8\text{ V}$ (High sink ports)

NRST pin

The NRST pin input driver is CMOS. A permanent pull-up is present. $R_{PU(NRST)}$ has the same value as R_{PU} (see [Table 26 on page 48](#)).

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 30. NRST pin characteristics

| Symbol | Parameter | Conditions | Min | Typ ⁽¹⁾ | Max | Unit |
|----------------|---|-------------------------|----------|--------------------|--------------|------------|
| $V_{IL(NRST)}$ | NRST input low level voltage ⁽¹⁾ | - | V_{SS} | - | 0.8 | V |
| $V_{IH(NRST)}$ | NRST input high level voltage ⁽¹⁾ | - | 1.4 | - | V_{DD} | |
| $V_{OL(NRST)}$ | NRST output low level voltage | $I_{OL} = 2 \text{ mA}$ | - | - | $V_{DD}-0.8$ | |
| $R_{PU(NRST)}$ | NRST pull-up equivalent resistor ⁽²⁾ | - | 30 | 45 | 60 | k Ω |
| $V_F(NRST)$ | NRST input filtered pulse ⁽³⁾ | - | - | - | 50 | ns |
| $t_{OP(NRST)}$ | NRST output pulse width | - | 20 | - | - | ns |
| $V_{NF(NRST)}$ | NRST input not filtered pulse ⁽³⁾ | - | 300 | - | - | ns |

1. Guaranteed by characterization results.
2. The R_{PU} pull-up equivalent resistor is based on a resistive transistor ([Figure 30](#)). Corresponding I_{PU} current characteristics are described in [Figure 31](#).
3. Guaranteed by design.

Figure 30. Typical NRST pull-up resistance R_{PU} vs. V_{DD}

Figure 31. Typical NRST pull-up current I_{PU} vs. V_{DD}

The reset network shown in [Figure 32](#) protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below the V_{IL} max. level specified in [Table 30](#). Otherwise the reset is not taken into account internally. For power consumption-sensitive applications, the capacity of the external reset capacitor can be reduced to limit the charge/discharge current. If the NRST signal is used to reset the external circuitry, the user must pay attention to the charge/discharge time of the external capacitor to meet the reset timing conditions of the external devices. The minimum recommended capacity is 10 nF.

Figure 32. Recommended NRST pin configuration

1. Correct device reset during power on sequence is guaranteed when $t_{VDD[max]}$ is respected.
2. External reset circuit is recommended to ensure correct device reset during power down, when $V_{PDR} < V_{DD} < V_{DD[min]}$.

9.3.7 Communication interfaces

Serial peripheral interface (SPI)

Unless otherwise specified, the parameters given in [Table 31](#) are derived from tests performed under ambient temperature, f_{MASTER} frequency and V_{DD} supply voltage conditions summarized in [Section 9.3.1](#). Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 31. SPI characteristics

| Symbol | Parameter | Conditions ⁽¹⁾ | Min | Max | Unit |
|--|------------------------------|---|-----------------------|-----------------------|------|
| f_{SCK} 1/ $t_{c(SCK)}$ | SPI clock frequency | Master mode | 0 | 8 | MHz |
| | | Slave mode | 0 | 8 | |
| $t_{r(SCK)}$ $t_{f(SCK)}$ | SPI clock rise and fall time | Capacitive load: C = 30 pF | - | 30 | ns |
| $t_{su(NSS)}^{(2)}$ | NSS setup time | Slave mode | $4 \times T_{MASTER}$ | - | |
| $t_{h(NSS)}^{(2)}$ | NSS hold time | Slave mode | 80 | - | |
| $t_{w(SCKH)}^{(2)}$ $t_{w(SCKL)}^{(2)}$ | SCK high and low time | Master mode, $f_{MASTER} = 8 \text{ MHz}, f_{SCK} = 4 \text{ MHz}$ | 105 | 145 | |
| $t_{su(MI)}^{(2)}$ $t_{su(SI)}^{(2)}$ | Data input setup time | Master mode | 30 | - | |
| | | Slave mode | 3 | - | |
| $t_{h(MI)}^{(2)}$ $t_{h(SI)}^{(2)}$ | Data input hold time | Master mode | 15 | - | |
| | | Slave mode | 0 | - | |
| $t_{a(SO)}^{(2)(3)}$ | Data output access time | Slave mode | - | $3 \times T_{MASTER}$ | |
| $t_{dis(SO)}^{(2)(4)}$ | Data output disable time | Slave mode | 30 | - | |
| $t_{v(SO)}^{(2)}$ | Data output valid time | Slave mode (after enable edge) | - | 60 | |
| $t_{v(MO)}^{(2)}$ | Data output valid time | Master mode (after enable edge) | - | 20 | |
| $t_{h(SO)}^{(2)}$ | Data output hold time | Slave mode (after enable edge) | 15 | - | |
| $t_{h(MO)}^{(2)}$ | | Master mode (after enable edge) | 1 | - | |

- Parameters are given by selecting 10-MHz I/O output frequency.
- Values based on design simulation and/or characterization results, and not tested in production.
- Min time is for the minimum time to drive the output and max time is for the maximum time to validate the data.
- Min time is for the minimum time to invalidate the output and max time is for the maximum time to put the data in Hi-Z.

Figure 33. SPI timing diagram - slave mode and CPHA = 0

ai14134

Figure 34. SPI timing diagram - slave mode and CPHA = 1⁽¹⁾

ai14135

1. Measurement points are done at CMOS levels: 0.3V_{DD} and 0.7V_{DD}.

Figure 35. SPI timing diagram - master mode⁽¹⁾

1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.

Inter IC control interface (I2C)

Subject to general operating conditions for V_{DD} , f_{MASTER} , and T_A unless otherwise specified.

The STM8L I²C interface meets the requirements of the Standard I²C communication protocol described in the following table with the restriction mentioned below:

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (SDA and SCL).

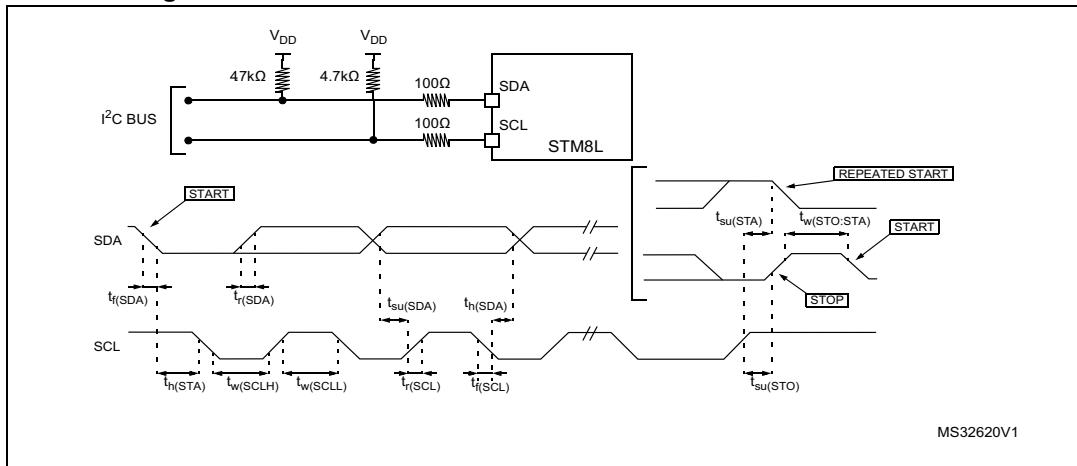

Table 32. I2C characteristics

| Symbol | Parameter | Standard mode I2C | | Fast mode I2C ⁽¹⁾ | | Unit |
|------------------------------|---|--------------------|--------------------|------------------------------|--------------------|---------------|
| | | Min ⁽²⁾ | Max ⁽²⁾ | Min ⁽²⁾ | Max ⁽²⁾ | |
| $t_{w(SCLL)}$ | SCL clock low time | 4.7 | - | 1.3 | - | μs |
| $t_{w(SCLH)}$ | SCL clock high time | 4.0 | - | 0.6 | - | |
| $t_{su(SDA)}$ | SDA setup time | 250 | - | 100 | - | ns |
| $t_{h(SDA)}$ | SDA data hold time | 0 ⁽³⁾ | - | 0 ⁽⁴⁾ | 900 ⁽³⁾ | |
| $t_{r(SDA)}$ $t_{r(SCL)}$ | SDA and SCL rise time | - | 1000 | - | 300 | |
| $t_{f(SDA)}$ $t_{f(SCL)}$ | SDA and SCL fall time | - | 300 | - | 300 | |
| $t_{h(STA)}$ | START condition hold time | 4.0 | - | 0.6 | - | μs |
| $t_{su(STA)}$ | Repeated START condition setup time | 4.7 | - | 0.6 | - | |
| $t_{su(STO)}$ | STOP condition setup time | 4.0 | - | 0.6 | - | μs |
| $t_{w(STO:STA)}$ | STOP to START condition time (bus free) | 4.7 | - | 1.3 | - | μs |
| C_b | Capacitive load for each bus line | - | 400 | - | 400 | pF |

1. f_{SCK} must be at least 8 MHz to achieve max fast I²C speed (400 kHz).
2. Data based on standard I²C protocol requirement, not tested in production.
3. The maximum hold time of the START condition has only to be met if the interface does not stretch the low period of SCL signal.
4. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL).

Note: For speeds around 200 kHz, achieved speed can have $\pm 5\%$ tolerance
 For other speed ranges, achieved speed can have $\pm 2\%$ tolerance
 The above variations depend on the accuracy of the external components used.

Figure 36. Typical application with I2C bus and timing diagram ¹⁾

1. Measurement points are done at CMOS levels: $0.3 \times V_{DD}$ and $0.7 \times V_{DD}$.

9.3.8 Comparator characteristics

Table 33. Comparator characteristics

| Symbol | Parameter | Conditions | Min ⁽¹⁾ | Typ | Max ⁽¹⁾ | Unit |
|---------------------|---|---|--------------------|-----|--------------------|---------|
| $V_{IN(Comp_REF)}$ | Comparator external reference | - | -0.1 | - | $V_{DD}-1.25$ | V |
| V_{IN} | Comparator input voltage range | - | -0.25 | - | $V_{DD}+0.25$ | V |
| $V_{offset}^{(2)}$ | Comparator offset error | - | - | - | ± 20 | mV |
| t_{START} | Startup time (after BIAS_EN) | - | - | - | $3^{(1)}$ | μs |
| $I_{DD(Comp)}$ | Analog comparator consumption | - | - | - | $25^{(1)}$ | μA |
| | Analog comparator consumption during power-down | - | - | - | $60^{(1)}$ | nA |
| $t_{propag}^{(2)}$ | Comparator propagation delay | 100-mV input step with 5-mV overdrive, input rise time = 1 ns | - | - | $2^{(1)}$ | μs |

- Guaranteed by design.
- The comparator accuracy depends on the environment. In particular, the following cases may reduce the accuracy of the comparator and must be avoided:
 - Negative injection current on the I/Os close to the comparator inputs
 - Switching on I/Os close to the comparator inputs
 - Negative injection current on not used comparator input.
 - Switching with a high dV/dt on not used comparator input.
 These phenomena are even more critical when a big external serial resistor is added on the inputs.

9.3.9 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Prequalification trials:

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring. Refer to application note *Software techniques for improving microcontrollers EMC performance* (AN1015).

Table 34. EMS data

| Symbol | Parameter | Conditions | Level/Class |
|------------|---|---|-------------|
| V_{FESD} | Voltage limits to be applied on any I/O pin to induce a functional disturbance | LQFP32, $V_{DD} = 3.3\text{ V}$ | 3B |
| V_{EFTB} | Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance | LQFP32, $V_{DD} = 3.3\text{ V}$, f_{HSI} | 3B |
| | | LQFP32, $V_{DD} = 3.3\text{ V}$, $f_{HSI}/2$ | 4A |

Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm SAE J 1752/3 which specifies the board and the loading of each pin.

Table 35. EMI data ⁽¹⁾

| Symbol | Parameter | Conditions | Monitored frequency band | Max vs. | Unit |
|------------------|------------|---|--------------------------|---------|------|
| | | | | 16 MHz | |
| S _{EMI} | Peak level | V _{DD} = 3.6 V, T _A = +25 °C, LQFP32 conforming to IEC61967-2 | 0.1 MHz to 30 MHz | -3 | dBμV |
| | | | 30 MHz to 130 MHz | -6 | |
| | | | 130 MHz to 1 GHz | -5 | |
| | | | SAE EMI Level | 1 | - |

1. Not tested in production.

Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin).

This test conforms to the JESD22-A114A/A115A standard.

Table 36. ESD absolute maximum ratings

| Symbol | Ratings | Conditions | Maximum value ⁽¹⁾ | Unit |
|-----------------------|---|-------------------------|------------------------------|------|
| V _{ESD(HBM)} | Electrostatic discharge voltage (human body model) | T _A = +25 °C | 2000 | V |
| V _{ESD(CDM)} | Electrostatic discharge voltage (charge device model) | | 500 | |

1. Guaranteed by characterization results.

Static latch-up

- **LU:** 2 complementary static tests are required on 10 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 37. Electrical sensitivities

| Symbol | Parameter | Class |
|--------|-----------------------|-------|
| LU | Static latch-up class | II |

9.4 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in [Table 16: General operating conditions on page 40](#).

The maximum chip-junction temperature, T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W
- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)
- P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in watts. This is the maximum chip internal power.
- $P_{I/Omax}$ represents the maximum power dissipation on output pins where:

$$P_{I/Omax} = \Sigma (V_{OL} * I_{OL}) + \Sigma ((V_{DD} - V_{OH}) * I_{OH})$$
 taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Table 38. Thermal characteristics⁽¹⁾

| Symbol | Parameter | Value | Unit |
|---------------|--|-------|------|
| Θ_{JA} | Thermal resistance junction-ambient LQFP 32 - 7 x 7 mm | 60 | °C/W |
| | Thermal resistance junction-ambient UFQFPN 32 - 5 x 5 mm | 25 | °C/W |
| | Thermal resistance junction-ambient UFQFPN 28 - 4 x 4 mm | 80 | °C/W |
| | Thermal resistance junction-ambient UFQFPN 20 - 3 x 3 mm - 0.6 mm | 102 | °C/W |
| | Thermal resistance junction-ambient TSSOP 20 | 110 | °C/W |

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

10 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.

10.1 UFQFPN32 package information

Figure 37. UFQFPN32 - 32-lead ultra thin fine pitch quad flat no-lead package outline (5 x 5)

1. Drawing is not to scale.
2. All leads/pads should be soldered to the PCB to improve the lead/pad solder joint life.
3. There is an exposed die pad on the underside of the UFQFPN package. It is recommended to connect and solder this back-side pad to PCB ground.

Device marking

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

Figure 39. UFQFPN32 marking example (package top view)

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering Samples to run qualification activity.

10.2 LQFP32 package information

Figure 40. LQFP32 - 32-pin low profile quad flat package outline (7 x 7)

11 Device ordering information

Figure 52. STM8L101xx ordering information scheme

1. For a list of available options (e.g. memory size, package) and order-able part numbers or for further information on any aspect of this device, please go to www.st.com or contact the ST Sales Office nearest to you.

12 STM8 development tools

Development tools for the STM8 microcontrollers include the full-featured STIce emulation system supported by a complete software tool package including C compiler, assembler and integrated development environment with high-level language debugger. In addition, the STM8 is to be supported by a complete range of tools including starter kits, evaluation boards and a low-cost in-circuit debugger/programmer.

12.1 Emulation and in-circuit debugging tools

The STIce emulation system offers a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8 application development is supported by a low-cost in-circuit debugger/programmer.

The STIce is the fourth generation of full featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including profiling and coverage to help detect and eliminate bottlenecks in application execution and dead code when fine tuning an application.

In addition, STIce offers in-circuit debugging and programming of STM8 microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STIce is based on a modular design that allows the users to order exactly what they need to meet their development requirements and to adapt their emulation system to support existing and future ST microcontrollers.

STIce key features

- Occurrence and time profiling and code coverage (new features)
- Program and data trace recording up to 128 KB records
- Read/write on the fly of memory during emulation
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows the users to specify the components that they need to meet their development requirements and adapt to future requirements
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

12.2 Software tools

STM8 development tools are supported by a complete, free software package from STMicroelectronics that includes ST Visual Develop (STVD) IDE and the ST Visual Programmer (STVP) software interface. STVD provides seamless integration of the Cosmic and Raisonance C compilers for STM8. A free version that outputs up to 32 Kbytes of code is available.

12.2.1 STM8 toolset

STM8 toolset with STVD integrated development environment and STVP programming software is available for free download at www.st.com. This package includes:

ST Visual Develop – Full-featured integrated development environment from ST, featuring

- Seamless integration of C and ASM toolsets
- Full-featured debugger
- Project management
- Syntax highlighting editor
- Integrated programming interface
- Support of advanced emulation features for STIce such as code profiling and coverage

ST Visual Programmer (STVP) – Easy-to-use, unlimited graphical interface allowing read, write and verify of the STM8 microcontroller Flash program memory, data EEPROM and option bytes. STVP also offers project mode for saving programming configurations and automating programming sequences.

12.2.2 C and assembly toolchains

Control of C and assembly toolchains is seamlessly integrated into the STVD integrated development environment, making it possible to configure and control the building of user application directly from an easy-to-use graphical interface.

Available toolchains include:

- **Cosmic C compiler for STM8** – One free version that outputs up to 32 Kbytes of code is available. For more information, see www.cosmic-software.com.
- **Raisonance C compiler for STM8** – One free version that outputs up to 32 Kbytes of code. For more information, see www.raisonance.com.
- **STM8 assembler linker** – Free assembly toolchain included in the STVD toolset, which allows the user to assemble and link their application source code.

12.3 Programming tools

During the development cycle, STIce provides in-circuit programming of the STM8 Flash microcontroller on the user's application board via the SWIM protocol. Additional tools are to include a low-cost in-circuit programmer as well as ST socket boards, which provide dedicated programming platforms with sockets for programming the STM8.

For production environments, programmers will include a complete range of gang and automated programming solutions from third-party tool developers already supplying programmers for the STM8 family.

| Date | Revision | Changes |
|-------------|----------|---|
| 14-Oct-2010 | 11 | <p>Added STM8L101F1 devices:</p> <p>Modified Table 1: Device summary on page 1, Table 2: STM8L101xx device feature summary on page 9 and Table 5: Flash and RAM boundary addresses on page 24</p> <p>Modified warning below Figure 3 on page 16 and below Table 4: STM8L101xx pin description on page 20</p> <p>Modified Figure 52: STM8L101xx ordering information scheme on page 79</p> <p>Modified text above Figure 32: Recommended NRST pin configuration on page 54</p> <p>Modified Figure 32 on page 54</p> |
| 02-Aug-2013 | 12 | <p>Added “The RAM content is preserved” in halt mode Section 3.6: Low power modes</p> <p>Reformatted Figure 2: Standard 20-pin UFQFPN package pinout, Figure 3: 20-pin UFQFPN package pinout for STM8L101F1U6ATR, STM8L101F2U6ATR and STM8L101F3U6ATR part numbers, Figure 4: 20-pin TSSOP package pinout, Figure 4: 20-pin TSSOP package pinout, Figure 5: Standard 28-pin UFQFPN package pinout, Figure 6: 28-pin UFQFPN package pinout for STM8L101G3U6ATR and STM8L101G2U6ATR part numbers and Figure 7: 32-pin package pinout</p> <p>Corrected NRST/PA1 pin OD output capability in Table 4: STM8L101xx pin description and corrected note 2. and 4.</p> <p>Added note “Slope control of all GPIO can be programmed except...” in Table 4: STM8L101xx pin description</p> <p>Added note under Table 5: Flash and RAM boundary addresses</p> <p>Replaced UM0320 with UM0470 in Section 7: Option bytes</p> <p>Updated OPT2 and OPT3 in Table 10: Option bytes</p> <p>Added additional note 2. references in Table 22: HSI oscillator characteristics</p> <p>Added note 2. under Table 17: Operating conditions at power-up / power-down and under Figure 32: Recommended NRST pin configuration</p> <p>Corrected ‘SCK output’ in Figure 35: SPI timing diagram - master mode⁽¹⁾</p> <p>Added top view in Figure 43: UFQFPN20 3 x 3 mm 0.6 mm package outline</p> <p>Repositioned the package layout and footprint for all packages.</p> <p>Replaced “Standard ports” with “High sink ports”</p> <p>Replaced “TIMx_TRIG” with “TIMx_ETR”</p> <p>Replaced all “Data guaranteed, each individual device tested in production” notes with “Tested in production”</p> |
| 31-Mar-2014 | 13 | Updated L3 value on Table 42 , added note 2) and 3) on Table 43 |
| 18-Dec-2014 | 14 | <p>Updated:</p> <ul style="list-style-type: none"> – Figure 46: UFQFPN20 - 20-lead, 3x3 mm, 0.5 mm pitch, ultra thin fine pitch quad flat package outline, – Table 42: UFQFPN20 - 20-lead ultra thin fine pitch quad flat package (3 x 3 mm) mechanical data. |

Table 44. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|--|
| 02-Aug-2016 | 15 | Added: – <i>Figure 39: UFQFPN32 marking example (package top view)</i> – <i>Figure 42: LQFP32 marking example (package top view)</i> – <i>Figure 45: UFQFPN28 marking example (package top view)</i> – <i>Figure 48: UFQFPN20 marking example (package top view)</i> – <i>Figure 51: TSSOP20 marking example (package top view)</i> Updated: – <i>Section 9.2: Absolute maximum ratings.</i> |
| 12-May-2017 | 16 | Updated: – All table footnotes from “Data guaranteed by design, not tested in production” to “Guaranteed by design” and “Data based on characterization results, not tested in production” to “Guaranteed by characterization results” – <i>Section : Device marking on page 66</i> – <i>Section : Device marking on page 69</i> – <i>Section : Device marking on page 72</i> – <i>Section : Device marking on page 75</i> – <i>Section : Device marking on page 78</i> – <i>Figure 46: UFQFPN20 - 20-lead, 3x3 mm, 0.5 mm pitch, ultra thin fine pitch quad flat package outline</i> – <i>Table 42: UFQFPN20 - 20-lead, 3x3 mm, 0.5 mm pitch, ultra thin fine pitch quad flat package mechanical data</i> |
