Evaluation Board

The basic evaluation board that you receive from Avago incorporates passive components and SMA connectors for the TX input (TXD) and RX output (RXD) port connection. This basic evaluation board allows you to connect waveform/pattern generators to the TXD with TTL input signal. Receiver's output signal can be monitored from RXD or RXout with oscilloscope using 50Ohm input setting. The logic of AFBR-1624Z/AFBR-2624Z (output high when input high) and AFBR-1629Z/AFBR-2529Z (output low when input high) is inverted.

Initial Setup

1. Connect 3.3V or 5V supply voltage to TXVCC and RXVCC
2. Connect 0V to TXGND and RXGND
3. Connect TXD to pattern generator output
4. Connect RXout or RXD to Oscilloscope or Bit Error Tester with 50Ohm impedance input.
