

Configurable Four Output, Low Jitter Crystal-less™ Clock Generator

Features

- Low RMS Phase Jitter: <1 ps (typ.)
- High Stability: ± 25 ppm, ± 50 ppm
- Wide Temperature Range:
 - Industrial -40°C to $+85^{\circ}\text{C}$
 - Ext. Commercial -20°C to $+70^{\circ}\text{C}$
- High Supply Noise Rejection: -50 dBc
- Four Format-Configurable Outputs:
 - LVPECL, LVDS, HCSL, LVCMOS
- Available Pin-Selectable Frequency Table
 - 1 Pin per Bank for 2 Frequency Sets
- Wide Frequency Range:
 - 2.3 MHz – 460 MHz
- 20-Pin QFN Footprint (5.0 mm x 3.2 mm)
- Excellent Shock and Vibration Immunity
- High Reliability
 - 20x better MTF than quartz-based devices
- Wide Supply Range of 2.25V to 3.6V
- Lead Free and RoHS-Compliant
- AEC-Q100 Automotive Qualified

Applications

- Communications and Networks
- Ethernet
 - 1G, 10GBASE-T/KR/LR/SR, and FCoE
- Storage Area Networks
 - SATA, SAS, Fibre Channel
- Passive Optical Networks
 - EPON, 10G-EPON, GPON, 10G-PON
- HD/SD/SDI Video and Surveillance
- Automotive
- Media and Video
- Embedded and Industrial

General Description

The DSC400 is a four output crystal-less™ clock generator. It utilizes proven PureSilicon™ MEMS technology to provide excellent jitter and stability while incorporating additional device functionality.

The nominal frequencies of the outputs can be identical or independently derived from common PLLs.

Each output may be configured independently to support a single-ended LVCMOS interface or a differential interface. Differential options include LVPECL, LVDS, or HCSL.

The DSC400 provides two independent select lines for choosing between two sets of pre-configured frequencies per bank. It also has two OE pins to allow for enabling and disabling outputs.

The DSC400 is packaged in a 20-pin QFN (5 mm x 3.2 mm) and is available in extended commercial and industrial temperature grades.

ESD Protection (MM)	400V
ESD Protection (CDM)	1.5 kV

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Temperature Ranges						
Operating Temperature Range (T)	T_A	-20	—	+70	°C	Ordering Option E
	T_A	-40	—	+85	°C	Ordering Option I
Junction Temperature	T_J	—	—	+150	°C	—
Storage Temperature Range	T_S	-40	—	+150	°C	—
Soldering Temperature	—	—	—	+260	°C	40 sec. max.

Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature, and the thermal resistance from junction to air (i.e., T_A , T_J , θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

3.0 OPERATIONAL DESCRIPTION

The DSC400 is a crystal-less™ clock generator. Unlike older clock generators in the industry, it does not require an external crystal to operate; it relies on the integrated MEMS resonator that interfaces with internal PLLs. This technology enhances performance and reliability by allowing tighter frequency stability over a far wider temperature range. In addition, the higher resistance to shock and vibration decreases the aging rate to allow for much improved product life in the system.

3.1 Inputs

There are four input signals in the device. Each has an internal (40 kΩ) pull-up to default the selection to a high (1). Inputs can be controlled through hardware strapping method with a resistor to ground to assert the input low (0). Inputs may also be controlled by other components' GPIOs

In case more than one frequency set is desired, FSB1 and FSB2 are used to independently select one of two sets per bank. FSB1 selects the pre-configured set on Bank1 (CLK0 and CLK3) and FSB2 selects the pre-configured set on Bank2 (CLK1 and CLK2), as shown in [Table 1-1](#) in the [Product Identification System](#) section.

If there is a requirement to disable outputs, the inputs OE1 and OE2 are used in conjunction to disable the banks of outputs. Outputs are disabled in tri-state (Hi-Z) mode. See [Table 3-1](#) for more information.

TABLE 3-1: OUTPUT ENABLE SELECTION TABLE

OE1	OE2	Bank 1 (CLK0 & CLK3)	Bank 2 (CLK1 & CLK2)
0	0	Hi-Z	Hi-Z
0	1	Hi-Z	Running
1	0	Running	Hi-Z
1	1	Running	Running

3.2 Outputs

The four outputs are grouped into two banks. Each bank is supplied by an independent V_{DD} to allow for optimized noise isolation between the two banks. Each bank provides two synchronous outputs generated by a common PLL:

- Bank1 is composed of outputs CLK0 and CLK3.
- Bank2 is composed of outputs CLK1 and CLK2.

Each output may be pre-configured independently to be one of the following formats: LVCMOS, LVDS, LVPECL or HCSL. In case the output is configured to be single-ended LVCMOS, the frequency is generated on the true output (CLKx+) and the complement output (CLKx-) is shut off in a low state. Frequencies can be

chosen from 2.3 MHz to 460 MHz for differential outputs and from 2.3 MHz to 170 MHz on LVCMOS outputs.

3.3 Power

V_{DD1} and V_{DD2} supply the power to banks 1 and 2 respectively. Each V_{DD} may each have a different supply voltage from the other as long as it is within the 2.25V to 3.6V range. Each V_{DD} pin should have a 0.1 μF capacitor to filter high-frequency noise. V_{SS} is common to the entire device.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
