General Description

The HMC427ALP3E is a low loss broadband positive control transfer switch in a leadless surface mount package. Covering DC to 8 GHz, this switch offers high isolation and low insertion loss. The switch operates using a positive control voltage of 0/+5V and requires a fixed bias of +5V @ < 20 μ A.

* Blocking capacitors are required at ports RF1, 2, 3, & 4. Their value will determine the lowest transmission frequency.

Electrical Specifications, $T_A = +25^\circ\text{C}$, With 0/+5V Control, 50 Ohm System

The circuit board used in the final application should be generated with proper RF circuit design techniques. Signal lines at the RF port should have 50 ohm impedance and the package ground leads and package bottom should be connected directly to the ground plane similar to that shown above. The evaluation circuit board shown above is available from Analog Devices upon request.
