Preferred parts, the suggested choice for new designs, have shorter lead times and are more readily available.
The column $\mathrm{H}(\mathrm{Oe})$ gives for each bead the calculated dc bias field in oersted for 1 turn and 1 ampere direct current. The actual dc H field in the application is this value of H times the actual NI (ampere-turn) product. For the effect of the dc bias on the impedance of the bead material, see figures $18-23$ in the application note How to choose Ferrite Components for EMI Suppression.
A $1 / 2$ turn is defined as a single pass through a hole.
$\sum_{l / A}$ - Core Constant
$\mathrm{A}_{\mathrm{e}}$ : Effective Cross-Sectional Area
$A_{L}$ - Inductance Factor ( $\frac{L}{N^{2}}$ )
${ }^{1} \mathrm{e}$ : Effective Path Length
$\mathrm{V}_{\mathrm{e}}$ : Effective Core Volume
NI - Value of dc Ampere-turns
