Rev.1.6_00

The S-5716 Series, developed by CMOS technology, is a high-accuracy Hall IC that operates with low current consumption. The output voltage changes when the S-5716 Series detects the intensity level of magnetic flux density. Using the S-5716 Series with a magnet makes it possible to detect the open / close in various devices.

High-density mounting is possible by using the small SOT-23-3 package or the super small SNT-4A package.

Due to its high-accuracy magnetic characteristics, the S-5716 Series can make operation's dispersion in the system combined with magnet smaller.

Caution This product is intended to use in general electronic devices such as consumer electronics, office equipment, and communications devices. Before using the product in medical equipment or automobile equipment including car audio, keyless entry and engine control unit, contact to SII is indispensable.

***1.** B_{OPN}, B_{OPS}: Operation points

B_{OPN} and B_{OPS} are the values of magnetic flux density when the output voltage (V_{OUT}) is inverted after the magnetic flux density applied to the S-5716 Series by the magnet (N pole or S pole) is increased (the magnet is moved closer).

Even when the magnetic flux density exceeds B_{OPN} or B_{OPS}, V_{OUT} retains the status.

***2.** B_{RPN}, B_{RPS}: Release points

B_{RPN} and B_{RPS} are the values of magnetic flux density when the output voltage (V_{OUT}) is inverted after the magnetic flux density applied to the S-5716 Series by the magnet (N pole or S pole) is decreased (the magnet is moved further away).

Even when the magnetic flux density falls below B_{RPN} or B_{RPS}, V_{OUT} retains the status.

***3.** B_{HYSN}, B_{HYS}: Hysteresis widths

B_{HYSN} and B_{HYS} are the difference between B_{OPN} and B_{RPN}, and B_{OPS} and B_{RPS}, respectively.

Remark The unit of magnetic density mT can be converted by using the formula 1 mT = 10 Gauss.

■ Operation

1. Direction of applied magnetic flux

The S-5716 Series detects the magnetic flux density which is vertical to the marking surface.
 In product with both poles detection, the output voltage (V_{OUT}) is inverted when the S pole or N pole is moved closer to the marking surface.
 In product with S pole detection, V_{OUT} is inverted when the S pole is moved closer to the marking surface.
 In product with N pole detection, V_{OUT} is inverted when the N pole is moved closer to the marking surface.
Figure 12 and **Figure 13** show the direction in which magnetic flux is being applied.

2. Position of Hall sensor

Figure 14 and **Figure 15** show the position of Hall sensor.
 The center of this Hall sensor is located in the area indicated by a circle, which is in the center of a package as described below.
 The following also shows the distance (typ. value) between the marking surface and the chip surface of a package.

3. Basic operation

The S-5716 Series changes the output voltage level (V_{OUT}) according to the level of the magnetic flux density (N pole or S pole) applied by a magnet.

The following explains the operation when the magnetism detection logic is active "L".

3.1 Product with both poles detection

When the magnetic flux density vertical to the marking surface exceeds the operation point (B_{OPN} or B_{OPS}) after the S pole or N pole of a magnet is moved closer to the marking surface of the S-5716 Series, V_{OUT} changes from "H" to "L". When the S pole or N pole of a magnet is moved further away from the marking surface of the S-5716 Series and the magnetic flux density is lower than the release point (B_{RPN} or B_{RPS}), V_{OUT} changes from "L" to "H".

Figure 16 shows the relationship between the magnetic flux density and V_{OUT} .

Figure 16

3.2 Product with S pole detection

When the magnetic flux density vertical to the marking surface exceeds B_{OPS} after the S pole of a magnet is moved closer to the marking surface of the S-5716 Series, V_{OUT} changes from "H" to "L". When the S pole of a magnet is moved further away from the marking surface of the S-5716 Series and the magnetic flux density is lower than B_{RPS} , V_{OUT} changes from "L" to "H".

Figure 17 shows the relationship between the magnetic flux density and V_{OUT} .

Figure 17

3.3 Product with N pole detection

When the magnetic flux density vertical to the marking surface exceeds B_{OPN} after the N pole of a magnet is moved closer to the marking surface of the S-5716 Series, V_{OUT} changes from "H" to "L". When the N pole of a magnet is moved further away from the marking surface of the S-5716 Series and the magnetic flux density is lower than B_{RPN} , V_{OUT} changes from "L" to "H".

Figure 18 shows the relationship between the magnetic flux density and V_{OUT} .

■ **Precautions**

- If the impedance of the power supply is high, the IC may malfunction due to a supply voltage drop caused by feed-through current. Take care with the pattern wiring to ensure that the impedance of the power supply is low.
- Note that the IC may malfunction if the power supply voltage rapidly changes.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- Large stress on this IC may affect on the magnetic characteristics. Avoid large stress which is caused by bend and distortion during mounting the IC on a board or handle after mounting.
- SII claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.
