- Ideal for 315 MHz Automotive-Keyless-Entry Transmitters
- Very Low Series Resistance
- Quartz Stability
- Complies with Directive 2002/95/EC (RoHS)

The RO3073E is a true one-port, surface-acoustic-wave (SAW) resonator in a surface-mount, ceramic case. It provides reliable, fundamental-mode, quartz frequency stabilization of local oscillators operating at approximately 315 MHz . This SAW was designed for AM transmitters in automotive-keyless-entry applications operating in the USA under FCC Part 15, in Canada under DoC RSS-210, and in Italy.

## Absolute Maximum Ratings

## NOTES:

1. Frequency aging is the change in $\mathrm{f}_{\mathrm{C}}$ with time and is specified at $+65^{\circ} \mathrm{C}$ or less. Aging may exceed the specification for prolonged temperatures above $+65^{\circ} \mathrm{C}$. Typically, aging is greatest the first year after manufacture, decreasing in subsequent years.
2. The center frequency, $\mathrm{f}_{\mathrm{C}}$, is measured at the minimum insertion loss point, $\mathrm{IL}_{\mathrm{MIN}}$ with the resonator in the $50 \Omega$ test system (VSWR $\leq 1.2: 1$ ). The shunt inductance, $\mathrm{L}_{\text {TEST }}$, is tuned for parallel resonance with $\mathrm{C}_{\mathrm{O}}$ at $\mathrm{f}_{\mathrm{C}}$. Typically, $\mathrm{f}_{\text {OSCILLATOR }}$ or $\mathrm{f}_{\text {TRANSMITTER }}$ is approximately equal to the resonator $\mathrm{f}_{\mathrm{C}}$
3. One or more of the following United States patents apply: 4,454,488 and 4,616,197.
4. Typically, equipment utilizing this device requires emissions testing and government approval, which is the responsibility of the equipment manufacturer.
5. Unless noted otherwise, case temperature $\mathrm{T}_{\mathrm{C}}=+25^{\circ} \mathrm{C} \pm 2^{\circ} \mathrm{C}$.
6. The design, manufacturing process, and specifications of this device are subject to change without notice.
7. Derived mathematically from one or more of the following directly measured parameters: $\mathrm{f}_{\mathrm{C}}, \mathrm{IL}, 3 \mathrm{~dB}$ bandwidth, $\mathrm{f}_{\mathrm{C}}$ versus $\mathrm{T}_{\mathrm{C}}$, and $\mathrm{C}_{\mathrm{O}}$.
8. Turnover temperature, $\mathrm{T}_{\mathrm{O}}$, is the temperature of maximum (or turnover) frequency, $\mathrm{f}_{\mathrm{O}}$. The nominal frequency at any case temperature, $\mathrm{T}_{\mathrm{C}}$, may be calculated from: $f=f_{O}\left[1-F T C\left(T_{O}-T_{C}\right)^{2}\right]$. Typically oscillator $T_{O}$ is approximately equal to the specified resonator $\mathrm{T}_{\mathrm{O}}$.
9. This equivalent RLC model approximates resonator performance near the resonant frequency and is provided for reference only. The capacitance $\mathrm{C}_{0}$ is the static (nonmotional) capacitance between the two terminals measured at low frequency ( 10 MHz ) with a capacitance meter. The measurement includes parasitic capacitance with "NC" pads unconnected. Case parasitic capacitance is approximately 0.05 pF . Transducer parallel capacitance can by calculated as: $\mathrm{C}_{\mathrm{P}} \approx \mathrm{C}_{\mathrm{O}}-0.05 \mathrm{pF}$.
10. Tape and Reel Standard Per ANSI / EIA 481.

## Electrical Connections

The SAW resonator is bidirectional and may be installed with either orientation. The two terminals are interchangeable and unnumbered. The callout NC indicates no internal connection. The NC pads assist with mechanical positioning and stability. External grounding of the NC pads is recommended to help reduce parasitic capacitance in the circuit.

| Pin | Connection |
| :---: | :---: |
| 1 | NC |
| 2 | Terminal |
| 3 | NC |
| 4 | NC |
| 5 | Terminal |
| 6 | NC |
