

## RF to IF Single Downconverting Mixer

600MHz to 1060MHz

### GENERAL DESCRIPTION

This document describes the specification for the IDTF1701 Zero-Distortion™ Lowband RF to IF Single Downconverting Mixer. This device is part of a series of mixers using lowside or highside LO injection options for all UTRA frequency bands. See the Part# Matrix for the detail of all devices in this series.

The F1701 single channel device is designed to operate with a single 5V supply. It is optimized for operation in a Multi-mode, Multi-carrier BaseStation Receiver over the frequency range from 600MHz to 1060MHz using either lowside or highside LO. IF frequencies from 70MHz to 300MHz are supported. Nominally, the device offers +43dBm Output IP3 using HS LO with 184mA of  $I_{cc}$ .

### COMPETITIVE ADVANTAGE

In typical basestation receivers, the RF to IF mixer dominates the linearity performance for the entire receive system. The Zero-Distortion™ family of mixers dramatically improve the maximum signal levels ( $IM_3$  tones) that the BTS can withstand at a desired Signal to Noise Ratio (SNR.) Zero-Distortion™ technology allows realization of either benefit. In basestation transmitters, digital pre-distortion (DPD) is employed to improve the Transmitter performance. By utilizing an ultra-linear mixer in the DPD RX path, such as the IDTF1701, the ACLR and/or power consumption of the full Tx system can be improved significantly. This is because the F1701 can directly drive an ADC through an Anti-Alias filter. Downstream amplification is not necessary in the DPD application.

- ✓  $IP3_0$ : ↑ **9 dB**
- ✓ Dissipation: ↓ **14%**
- ✓ Allows for higher RF gain improving **Sensitivity**
- ✓ Eliminates the need for an ADC driver or IF VGA in DPD linearization path

### FEATURES

- Ideal for Multi-Carrier Systems
- Lowside or Highside LO
- 11.8dB Gain
- Ultra linear +43dBm  $IP3_0$  using HS LO or +42dBm  $IP3_0$  using LS LO
- 9.2dB NF
- 200  $\Omega$  output impedance
- Wide flat performance IF BW
- Drives ADC directly for DPD applications
- Low Power Consumption
- 5x5 20 pin package
- Standby Mode

### DEVICE BLOCK DIAGRAM

### ORDERING INFORMATION

### PART# MATRIX

Part#	RF Range	UTRA bands	IF freq range	Typ. Gain	Injection
F1701	600 - 1060	5, 6, 8, 12, 13, 14, 17, 18, 19, 20, 26	70 - 300	11.8	Both
F1751	1400 - 2500	1, 2, 3, 4, 9, 10, 11, 21, 23, 24, 25, 33, 34, 35, 36, 37, 39, 40	50 - 500	11.8	Both
F1763	2000 - 2900	7, 38, 40, 41	50 - 500	11.7	Both

**ABSOLUTE MAXIMUM RATINGS**

VCC to GND	-0.3V to +5.5V
STBY	-0.3V to (VCC + 0.3V)
IF_OUT+, IF_OUT-, RF_IN	-0.3V to (VCC + 0.3V)
LO_IN	-0.3V to +0.3V
IF_SET to GND, IF_BIAS to GND	-0.3V to +1.2V
RF Input Power	+20dBm
Continuous Power Dissipation	1.3W
$\theta_{JA}$ (Junction – Ambient)	+40°C/W
$\theta_{JC}$ (Junction – Case) The Case is defined as the exposed paddle	+3°C/W
Operating Temperature Range (Case Temperature)	$T_C = -40^\circ\text{C}$ to $+105^\circ\text{C}$
Maximum Junction Temperature	150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+260°C

*Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

**IDTF1701 RECOMMENDED OPERATING CONDITIONS**

Parameter	Comment	Symbol	min	typ	max	Units
Supply Voltage(s)	All V <sub>CC</sub> pins	V <sub>CC</sub>	4.75		5.25	V
Operating Temperature Range	Case Temperature	T <sub>CASE</sub>	-40		+105	degC
RF Freq Range	Sets LO freq range	F <sub>RF1</sub>	698		960	MHz
Oversample RF Range	<ul style="list-style-type: none"><li>▪ Measure gain at 200MHz IF</li><li>▪ FLO = 800MHz, 1260MHz</li></ul>	F <sub>RF2</sub>	600		1060	
LO Freq Range			630		1260	
IF Freq Range	Sets LO freq range	F <sub>IF</sub>	70		300	

**RF to IF Single Downconverting Mixer**

**600MHz to 1060MHz**

**IDTF1701 SPECIFICATION**

Refer to Typical Application Circuit when operated with  $V_{CC} = +5.0V$ ,  $T_C = +25^\circ C$ ,  $F_{RF} = 950\text{ MHz}$ ,  $F_{IF} = 200\text{ MHz}$ ,  $F_{LO} = 1150\text{ MHz}$ ,  $P_{LO} = 0\text{ dBm}$ , output power = +1dBm per tone, STBY = GND unless otherwise noted. Transformer loss is de-embedded unless otherwise noted.

### **TYPICAL OPERATING CONDITIONS**

Unless otherwise noted, the following conditions apply to the Typ Ops Graphs:

- $V_{CC} = +5.0V$
- $STBY = GND$
- $T_C = +25^{\circ}C$
- $F_{RF} = 950\text{ MHz}$
- $F_{IF} = 200\text{ MHz}$
- $F_{LO} = 1150\text{ MHz}$
- $P_{LO} = 0\text{ dBm}$
- $P_{in} = -10\text{ dBm}$  per tone
- Transformer loss is de-embedded for Gain, Output P1dB and OIP3 Graphs

## PACKAGE DRAWING (NBG20)

**PIN DIAGRAM**

**BLACK TEXT** is recommended external connection  
**RED TEXT** denotes internal function or connection

**TOP View**

*(looking through the top of the package)*

**PIN DESCRIPTIONS**

Pin	Name	Function
1	VCC	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
2	RF_IN	RF Input. Internally matched to 50Ω. Do not apply DC to this pin.
3	GND [RF_RTN]	RF input Balun return. Ground this pin
4	GND	Internally bonded to GND
5	GND [NC]	No Connection. Not internally connected. OK to connect to VCC. OK to connect to GND.
6	VCC [NC]	No Connection. Not internally connected. OK to connect to VCC. OK to connect to GND.
7	IF_BIAS	Connect the specified resistor from this pin to ground to optimize linearity.
8	VCC	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
9	NC [die ID]	This pin serves as the die ID. Leave it unconnected
10	GND	Internally bonded to GND
11	LO_IN	Local Oscillator Input. This input is internally matched to 50Ω. This pin requires an input DC-blocking capacitor
12	GND	Internally bonded to GND
13	GND [LO_ADJ]	Ground this pin for best linearity performance. A resistor from this pin to GND can be used to reduce DC power consumption while slightly degrading linearity performance.
14	VCC	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
15	NC	No Connection. Not internally connected. OK to connect to VCC. OK to connect to GND.
16	L_EXT	Connect an external inductor to GND to optimize LO-IF leakage performance.
17	STBY	Ground for normal operation. Pull high to disable
18	IF_OUT-	Mixer Differential IF Output. Connect pullup inductor from this pin to VCC (see the Typical Application Circuit).
19	IF_OUT+	Mixer Differential IF Output. Connect pullup inductor from this pin to VCC (see the Typical Application Circuit).
20	IF_SET	Connect the specified resistor from this pin to ground to set the correct Icc for the IF amplifier.
	— EP	Exposed Pad. Internally connected to GND. Connect to Ground with multiple vias for good thermal relief

### EVKIT / APPLICATION CIRCUIT

**POWER SUPPLIES**

All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than 1V/20uS. In addition, all control pins should remain at 0V (+/-0.3V) while the supply voltage ramps or while it returns to zero.

**EVKIT PICTURE/LAYOUT/OPERATION**

## RF to IF Single Downconverting Mixer
