

World's First Wide-Range 6-Axis MEMS MotionTracking™ Device for Sports and High Impact Applications

GENERAL DESCRIPTION

Many of today's wearable and sports solutions, which analyze the motion of a user's golf or tennis swings, soccer ball kicks, or basketball activities, require higher than currently available ± 2000 dps (degrees per second) FSR for gyroscope and $\pm 16g$ FSR for accelerometer to better insure that critical data is not lost at the point of high impact or high speed rotation. The ICM-20649 6-axis inertial sensor offers the smallest size, lowest profile and lowest power in conjunction with industry leading high FSR.

With an extended FSR range of ± 4000 dps for gyroscope and $\pm 30g$ for accelerometer, the ICM-20649 enables precise analysis of contact sports applications providing continuous motion sensor data before, during and after impact providing more accurate feedback

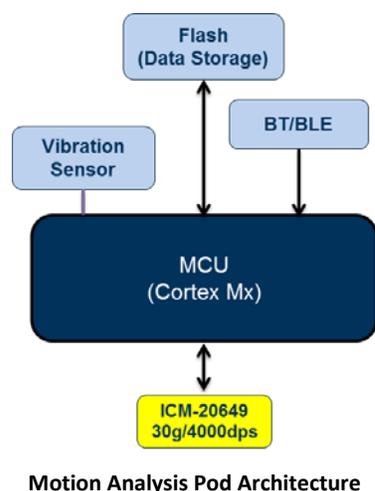

The ICM-20649 is the world's first wide-range 6-axis MotionTracking device for Sports and other High Impact applications. It is available in a 3x3x0.9 mm 24-pin QFN package.

APPLICATIONS

- Sports
- Wearable Sensors
- High Impact Applications

FEATURES

- 3-Axis gyroscope with programmable FSR of ± 500 dps, ± 100 dps, ± 2000 dps, and ± 4000 dps
- 3-Axis accelerometer with programmable FSR of $\pm 4g$, $\pm 8g$, $\pm 16g$, and $\pm 30g$
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- 512-byte FIFO buffer enables the applications processor to read the data in bursts
- On-Chip 16-bit ADCs and Programmable Filters
- DMP Enabled:
 - SMD, Step Count, Step Detect, Activity Classifier, RV, GRV
 - Calibration of accel/gyro/compass
- Host interface: 7 MHz SPI or 400 kHz I²C
- Digital-output temperature sensor
- VDD operating range of 1.71V to 3.6V
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

This document is a preliminary product specification, providing a description, specifications, and design related information on the ICM-20649 MotionTracking device.

Final specifications are available via our sales contacts. For references to register map and descriptions of individual registers, please refer to the ICM-20649 Register Map and Register Descriptions sections.

1.2 PRODUCT OVERVIEW

The ICM-20649 is a MotionTracking device that combines a 3-axis gyroscope, 3-axis accelerometer, and a Digital Motion Processor™ (DMP) all in a small 3.0x3.0x0.9mm QFN package. The device supports the following features:

- Android Lollipop support
- FIFO of size 512 bytes (FIFO size will vary depending on DMP feature-set)
- Runtime Calibration
- Enhanced FSYNC functionality to improve timing for applications like EIS

ICM-20649 devices, with their 6-axis integration, on-chip DMP, and run-time calibration firmware, enable manufacturers to eliminate the costly and complex selection, qualification, and system level integration of discrete devices, guaranteeing optimal motion performance for consumers.

The gyroscope has a programmable full-scale range up to ± 4000 dps. The accelerometer has a user-programmable accelerometer full-scale range up to $\pm 30g$. Factory-calibrated initial sensitivity of both sensors reduces production-line calibration requirements.

Other key features include on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features I²C and SPI serial interfaces, a VDD operating range of 1.71V to 3.6V, and a separate digital IO supply, VDDIO from 1.71V to 3.6V.

Communication with all registers of the device is performed using I²C at up to 100 kHz (standard-mode) or up to 400 kHz (fast-mode), or SPI at up to 7 MHz.

By leveraging its patented and volume-proven CMOS-MEMS fabrication platform, which integrates MEMS wafers with companion CMOS electronics through wafer-level bonding, InvenSense has driven the package size down to a footprint and thickness of 3.0x3.0x0.9 mm (24-pin QFN), to provide a very small yet high-performance, low-cost package. The device provides high robustness by supporting 10,000g shock reliability.

2 FEATURES

2.1 GYROSCOPE FEATURES

The triple-axis MEMS gyroscope in the ICM-20649 includes the following features:

- Digital-output X-, Y-, and Z-axis angular rate sensors (gyroscopes) with a user-programmable full-scale range of ± 500 dps, ± 1000 dps, ± 2000 dps, and ± 4000 dps and integrated 16-bit ADCs
- Digitally-programmable low-pass filter
- Factory calibrated sensitivity scale factor
- Self-test

2.2 ACCELEROMETER FEATURES

The triple-axis MEMS accelerometer in ICM-20649 includes the following features:

- Digital-output X-, Y-, and Z-axis accelerometer with a programmable full scale range of $\pm 4g$, $\pm 8g$, $\pm 16g$, and $\pm 30g$ and integrated 16-bit ADCs
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- Self-test

2.3 DMP FEATURES

The DMP in ICM-20649 includes the following capabilities:

- Offloads computation of motion processing algorithms from the host processor. The DMP can be used to minimize power, simplify timing, simplify the software architecture, and save valuable MIPS on the host processor for use in applications.
- Optimized for Android Lollipop for low power features (AP suspended) including SMD, Step Count, Step Detect, Activity Classification, Rotation Vector, and Gaming Rotation Vector
- Optimized for Android Lollipop batching, both while the AP is active and suspended. The DMP will also batch data from externally connected sensors such as a compass, or pressure sensor.
- The DMP enables ultra-low power run-time and background calibration of the accelerometer, gyroscope, and compass, maintaining optimal performance of the sensor data for both physical and virtual sensors generated through sensor fusion. This enables the best user experience for all sensor enabled applications for the lifetime of the device.
- DMP features simplify the software architecture resulting in quicker time to market.
- DMP features are OS, Platform, and Architecture independent, supporting virtually any AP, MCU, or other embedded architecture.

2.4 ADDITIONAL FEATURES

The ICM-20649 includes the following additional features:

- I²C at up to 100 kHz (standard-mode) or up to 400 kHz (fast-mode) or SPI at up to 7 MHz for communication with registers
- Auxiliary master I²C bus for reading data from external sensors (e.g. magnetometer)
- Digital-output temperature sensor
- 10,000g shock tolerant
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

4.4 BLOCK DIAGRAM

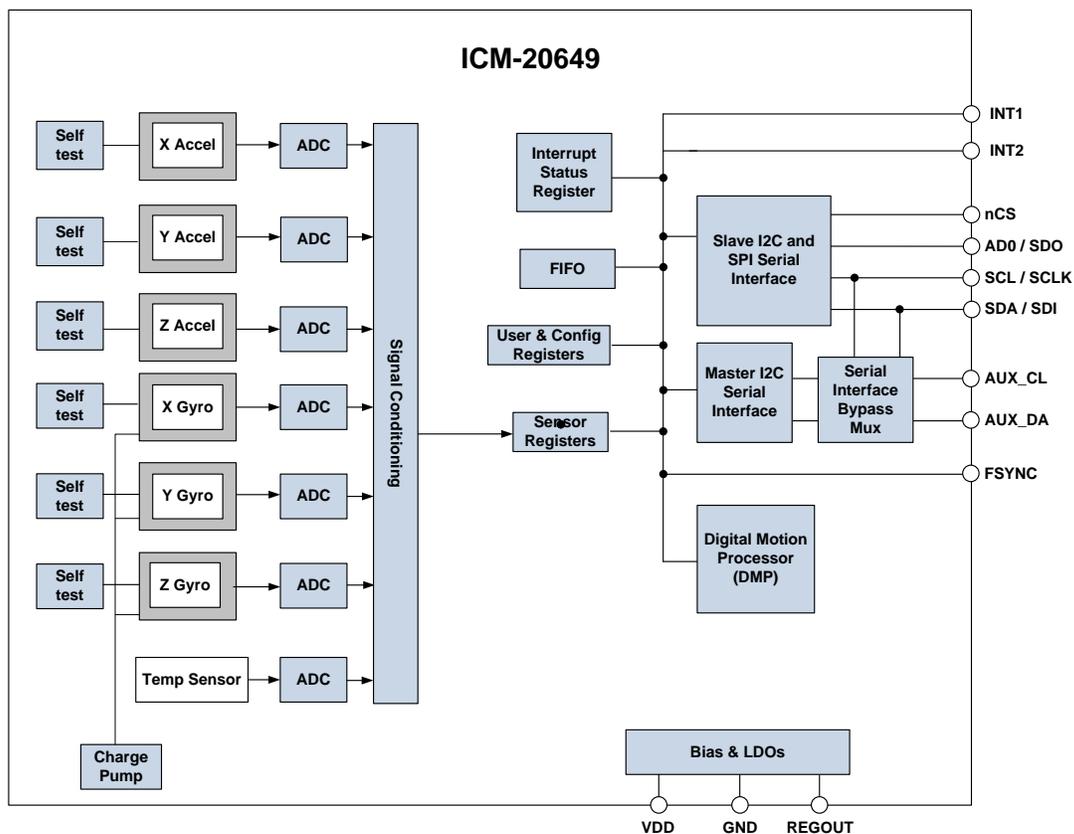

Figure 5. ICM-20649 Block Diagram

4.5 OVERVIEW

The ICM-20649 is comprised of the following key blocks and functions:

- Three-axis MEMS rate gyroscope sensor with 16-bit ADCs and signal conditioning
- Three-axis MEMS accelerometer sensor with 16-bit ADCs and signal conditioning
- Digital Motion Processor (DMP) engine
- Primary I²C and SPI serial communications interfaces
- Auxiliary I²C serial interface
- Self-Test
- Clocking
- Sensor Data Registers
- FIFO
- FSYNC
- Interrupts
- Digital-Output Temperature Sensor
- Bias and LDOs
- Charge Pump
- Power Modes

4.6 THREE-AXIS MEMS GYROSCOPE WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICM-20649 consists of three independent vibratory MEMS rate gyroscopes, which detect rotation about the X-, Y-, and Z- Axes. When the gyros are rotated about any of the sense axes, the Coriolis Effect causes a vibration that is detected by a capacitive pickoff. The resulting signal is amplified, demodulated, and filtered to produce a voltage that is proportional to the angular rate. This voltage is digitized using individual on-chip 16-bit Analog-to-Digital Converters (ADCs) to sample each axis. The full-scale range of the gyro sensors may be digitally programmed to ± 500 , ± 1000 , ± 2000 , or ± 4000 degrees per second (dps).

4.7 THREE-AXIS MEMS ACCELEROMETER WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICM-20649's 3-Axis accelerometer uses separate proof masses for each axis. Acceleration along a particular axis induces displacement on the corresponding proof mass, and capacitive sensors detect the displacement differentially. The ICM-20649's architecture reduces the accelerometers' susceptibility to fabrication variations as well as to thermal drift. When the device is placed on a flat surface, it will measure $0g$ on the X- and Y-axes and $+1g$ on the Z-axis. The accelerometers' scale factor is calibrated at the factory and is nominally independent of supply voltage. Each sensor has a dedicated sigma-delta ADC for providing digital outputs. The full scale range of the digital output can be adjusted to $\pm 4g$, $\pm 8g$, $\pm 16g$, or $\pm 30g$.

4.8 DIGITAL MOTION PROCESSOR

The embedded Digital Motion Processor (DMP) within the ICM-20649 offloads computation of motion processing algorithms from the host processor. The DMP acquires data from accelerometers, gyroscopes, and additional third party sensors such as magnetometers, and processes the data. The resulting data can be read from the FIFO. The DMP has access to the external pins, which can be used for generating interrupts.

The purpose of the DMP is to offload both timing requirements and processing power from the host processor. Typically, motion processing algorithms should be run at a high rate, often around 200 Hz, in order to provide accurate results with low latency. This is required even if the application updates at a much lower rate; for example, a low power user interface may update as slowly as 5 Hz, but the motion processing should still run at 200 Hz. The DMP can be used to minimize power, simplify timing, simplify the software architecture, and save valuable MIPS on the host processor for use in applications.

The DMP is optimized for Android Lollipop support.

4.9 PRIMARY I²C AND SPI SERIAL COMMUNICATIONS INTERFACES

The ICM-20649 communicates to a system processor using either a SPI or an I²C serial interface. The ICM-20649 always acts as a slave when communicating to the system processor. The LSB of the of the I²C slave address is set by pin 1 (ADO).

4.9.1 ICM-20649 Solution Using I²C Interface

In Figure 6, the system processor is an I²C master to the ICM-20649. In addition, the ICM-20649 is an I²C master to the optional external compass sensor. The ICM-20649 has limited capabilities as an I²C Master, and depends on the system processor to manage the initial configuration of any auxiliary sensors. The ICM-20649 has an interface bypass multiplexer, which connects the system processor I²C bus pins 23 and 24 (SCL and SDA) directly to the auxiliary sensor I²C bus pins 7 and 21 (AUX_CL and AUX_DA).

Once the auxiliary sensors have been configured by the system processor, the interface bypass multiplexer should be disabled so that the ICM-20649 auxiliary I²C master can take control of the sensor I²C bus and gather data from the auxiliary sensors.

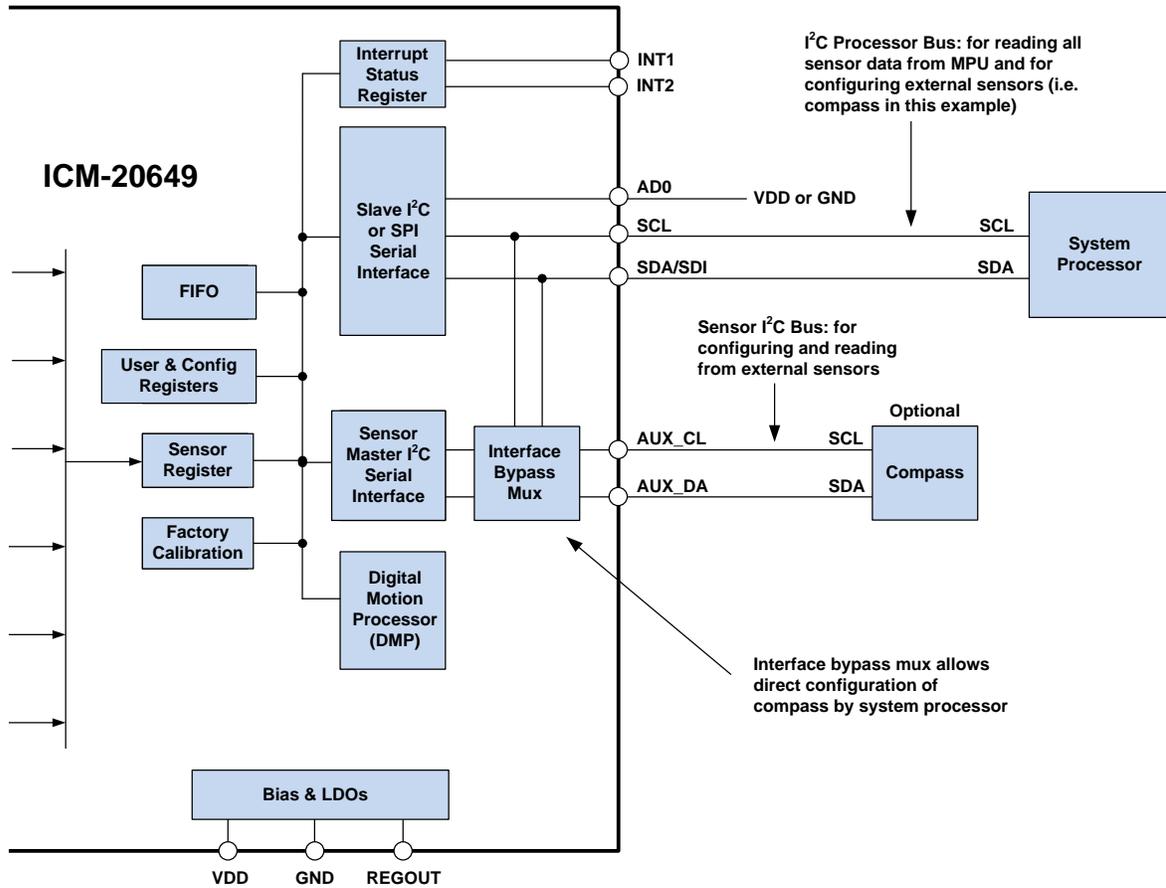

Figure 6. ICM-20649 Solution Using I2C Interface

4.9.2 ICM-20649 Solution Using SPI Interface

In Figure 7, the system processor is an SPI master to the ICM-20649. Pins 9, 22, 23, and 24 are used to support the SDO, nCS, SCLK, and SDI signals for SPI communications. Because these SPI pins are shared with the I²C slave pins (9, 23 and 24), the system processor cannot access the auxiliary I²C bus through the interface bypass multiplexer, which connects the processor I²C interface pins to the sensor I²C interface pins. Since the ICM-20649 has limited capabilities as an I²C Master, and depends on the system processor to manage the initial configuration of any auxiliary sensors, another method must be used for programming the sensors on the auxiliary sensor I²C bus pins 7 and 21 (AUX_CL and AUX_DA).

When using SPI communications between the ICM-20649 and the system processor, configuration of devices on the auxiliary I²C sensor bus can be achieved by using I²C Slaves 0-4 to perform read and write transactions on any device and register on the auxiliary I²C bus. The I²C Slave 4 interface can be used to perform only single byte read and write transactions. Once the external sensors have been configured, the ICM-20649 can perform single or multi-byte reads using the sensor I²C bus. The read results from the Slave 0-3 controllers can be written to the FIFO buffer as well as to the external sensor registers.

For more information regarding the control of the ICM-20649's auxiliary I²C interface, please refer to the ICM-20649 Register Map and Register Descriptions sections.

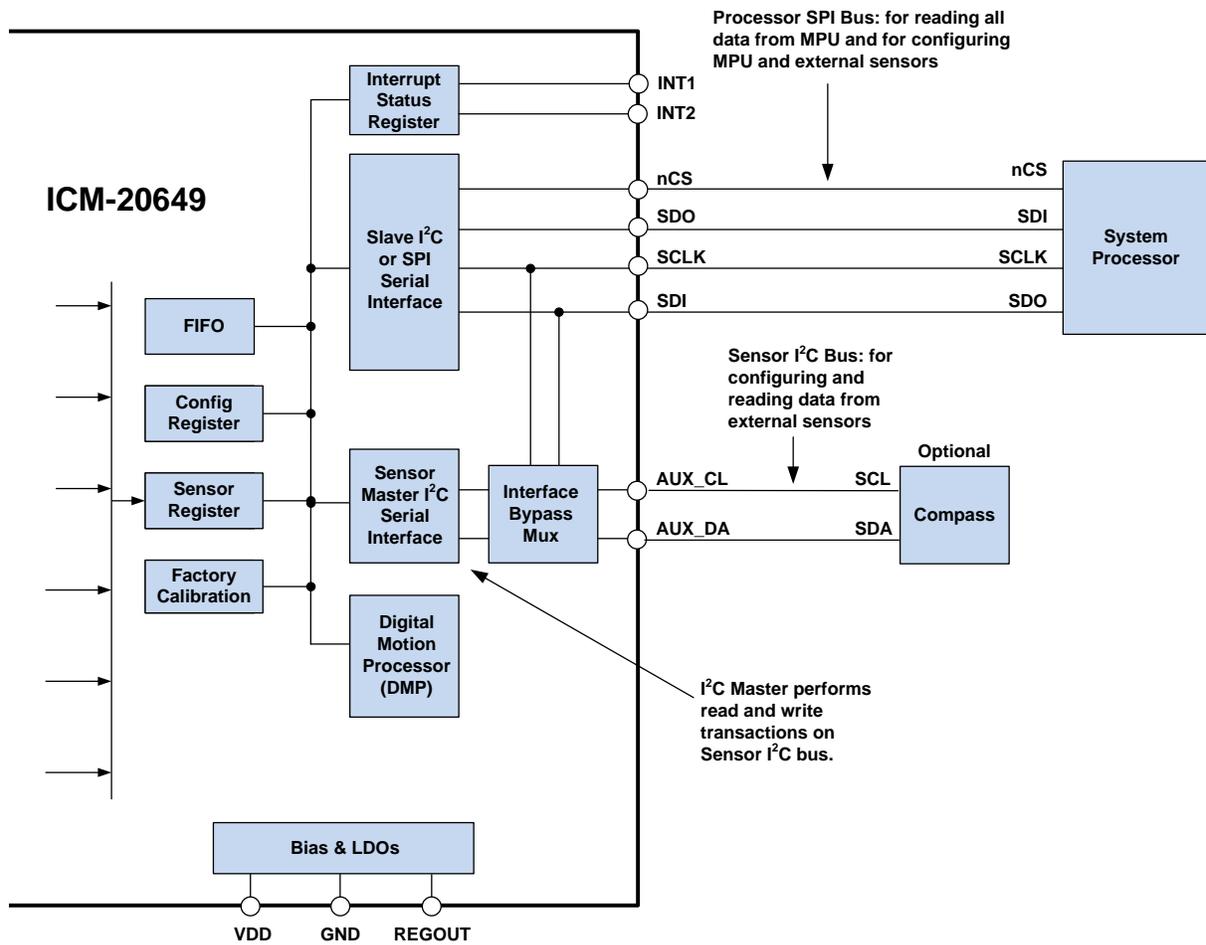

Figure 7. ICM-20649 Solution Using SPI Interface

4.10 AUXILIARY I²C SERIAL INTERFACE

The ICM-20649 has an auxiliary I²C bus for communicating to an off-chip 3-Axis digital output magnetometer or other sensors. This bus has two operating modes:

- **I²C Master Mode:** The ICM-20649 acts as a master to any external sensors connected to the auxiliary I²C bus
- **Pass-Through Mode:** The ICM-20649 directly connects the primary and auxiliary I²C buses together, allowing the system processor to directly communicate with any external sensors.

4.11 AUXILIARY I²C BUS MODES OF OPERATION:

I²C Master Mode: Allows the ICM-20649 to directly access the data registers of external digital sensors, such as a magnetometer. In this mode, the ICM-20649 directly obtains data from auxiliary sensors without intervention from the system applications processor.

For example, in I²C Master mode, the ICM-20649 can be configured to perform burst reads, returning the following data from a magnetometer:

- X magnetometer data (2 bytes)
- Y magnetometer data (2 bytes)
- Z magnetometer data (2 bytes)

The I²C Master can be configured to read up to 24 bytes from up to 4 auxiliary sensors. A fifth sensor can be configured to work single byte read/write mode.

Pass-Through Mode: Allows an external system processor to act as master and directly communicate to the external sensors connected to the auxiliary I²C bus pins (AUX_DA and AUX_CL). In this mode, the auxiliary I²C bus control logic (3rd party sensor interface block) of the ICM-20649 is disabled, and the auxiliary I²C pins AUX_CL and AUX_DA (pins 7 and 21) are connected to the main I²C bus (Pins 23 and 24) through analog switches internally. Pass-Through mode is useful for configuring the external sensors.

4.12 SELF-TEST

Self-test allows for the testing of the mechanical and electrical portions of the sensors. The self-test for each measurement axis can be activated by means of the gyroscope and accelerometer self-test registers.

When the self-test is activated, the electronics cause the sensors to be actuated and produce an output signal. The output signal is used to observe the self-test response.

The self-test response is defined as follows:

$$\text{SELF-TEST RESPONSE} = \text{SENSOR OUTPUT WITH SELF-TEST ENABLED} - \text{SENSOR OUTPUT WITHOUT SELF-TEST ENABLED}$$

The self-test response for each gyroscope axis is defined in the gyroscope specification table, while that for each accelerometer axis is defined in the accelerometer specification table.

When the value of the self-test response is within the specified min/max limits, the part has passed self-test. When the self-test response exceeds the min/max values, the part is deemed to have failed self-test. It is recommended to use InvenSense MotionApps software for executing self-test.

4.13 CLOCKING

The internal system clock sources include: (1) an internal relaxation oscillator, and (2) a PLL with MEMS gyroscope oscillator as the reference clock. With the recommended clock selection setting (CLKSEL = 1), the best clock source for optimum sensor performance and power consumption will be automatically selected based on the power mode. Specifically, the internal relaxation oscillator will be selected when operating in accelerometer only mode, while the PLL will be selected whenever gyroscope is on, which includes gyroscope and 6-axis modes.

As clock accuracy is critical to the preciseness of distance and angle calculations performed by DMP, it should be noted that the internal relaxation oscillator and PLL show different performances in some aspects. The internal relaxation oscillator is trimmed to have a consistent operating frequency at room temperature, while the PLL clock frequency varies from part to part. The PLL frequency deviation from the nominal value in percentage is captured in register `TIMEBASE_CORRECTION_PLL` (detailed in section 12.5), and users can factor it in during distance and angle calculations to not sacrifice accuracy. Other than that, PLL has better frequency stability and lower frequency variation over temperature than the internal relaxation oscillator.

4.14 SENSOR DATA REGISTERS

The sensor data registers contain the latest gyro, accelerometer, auxiliary sensor, and temperature measurement data. They are read-only registers, and are accessed via the serial interface. Data from these registers may be read anytime.

4.15 FIFO

The ICM-20649 contains a FIFO of size 512 bytes (FIFO size will vary depending on DMP feature-set) that is accessible via the Serial Interface. The FIFO configuration register determines which data is written into the FIFO. Possible choices include gyro data, accelerometer data, temperature readings, auxiliary sensor readings, and `FSYNC` input.

A FIFO counter keeps track of how many bytes of valid data are contained in the FIFO. The FIFO register supports burst reads. The interrupt function may be used to determine when new data is available.

For further information regarding the FIFO, please refer to the ICM-20649 Register Map and Register Descriptions sections.

4.16 FSYNC

The `FSYNC` pin can be used from an external interrupt source to wake up the device from sleep. It is particularly useful in EIS applications to synchronize the gyroscope ODR with external inputs from an imaging sensor. Connecting the `VSYNC` or `HSYNC` pin of the image sensor subsystem to `FSYNC` on ICM-20649 allows timing synchronization between the two otherwise unconnected subsystems.

An `FSYNC_ODR` delay time register is used to capture the delay between an `FSYNC` pulse and the very next gyroscope data ready pulse.

4.17 INTERRUPTS

Interrupt functionality is configured via the Interrupt Configuration register. Items that are configurable include the INT pins configuration, the interrupt latching and clearing method, and triggers for the interrupt. Section 5 provides a summary of interrupt sources. The ICM-20649 includes two interrupt pins, INT1 and INT2. Certain DMP-based interrupts are mapped to INT2 while all other interrupts are mapped to INT1. The interrupt status can be read from the Interrupt Status register.

For further information regarding interrupts, please refer to the ICM-20649 Register Map and Register Descriptions sections.

4.18 DIGITAL-OUTPUT TEMPERATURE SENSOR

An on-chip temperature sensor and ADC are used to measure the ICM-20649 die temperature. The readings from the ADC can be read from the FIFO or the Sensor Data registers.

4.19 BIAS AND LDOS

The bias and LDO section generates the internal supply and the reference voltages and currents required by the ICM-20649. Its two inputs are an unregulated VDD and a VDDIO logic reference supply voltage. The LDO output is bypassed by a capacitor at REGOUT. For further details on the capacitor, please refer to the Bill of Materials for External Components.

4.20 CHARGE PUMP

An on-chip charge pump generates the high voltage required for the MEMS oscillators.

4.21 POWER MODES

The following table lists the user-accessible power modes for ICM-20649.

MODE	NAME	GYRO	ACCEL	DMP
1	Sleep Mode	Off	Off	Off
2	Accelerometer Mode	Off	Low-Noise or Duty-Cycled	Duty-Cycled or Off
3	Gyroscope Mode	Low-Noise or Duty-Cycled	Off	Duty-Cycled or Off

5	DMP only mode	Off	Off	Duty-Cycled

Table 11. Power Modes for ICM-20649

Note: The standard mode of gyroscope and accelerometer operation is duty-cycled.

5 PROGRAMMABLE INTERRUPTS

The ICM-20649 has a programmable interrupt system which can generate an interrupt signal on the INT pins. Status flags indicate the source of an interrupt. Interrupt sources may be enabled and disabled individually. The following table lists the interrupt sources and which interrupt may propagate to which pin.

INTERRUPT SOURCE	INTERRUPT PIN
DMP Interrupt	INT1/INT2
Wake on Motion Interrupt	INT1
PLL RDY Interrupt	INT1
I2C Master Interrupt	INT1
Raw Data Ready Interrupt	INT1
FIFO Overflow Interrupt	INT1

For information regarding interrupt registers, please refer to the ICM-20649 Register Map and Register Descriptions sections.

6 DIGITAL INTERFACE

6.1 I²C AND SPI SERIAL INTERFACES

The internal registers and memory of the ICM-20649 can be accessed using either I²C at 400 kHz or SPI at 7 MHz. SPI operates in four-wire mode.

Pin Number	Pin Name	Pin Description
9	AD0 / SDO	I ² C Slave Address LSB (AD0); SPI serial data output (SDO)
22	nCS	Chip select (SPI mode only)
23	SCL / SCLK	I ² C serial clock (SCL); SPI serial clock (SCLK)
24	SDA / SDI	I ² C serial data (SDA); SPI serial data input (SDI)

Table 13. Serial Interface

Note: To prevent switching into I²C mode when using SPI, the I²C interface should be disabled by setting the *I2C_IF_DIS* configuration bit. Setting this bit should be performed immediately after waiting for the time specified by the “Start-Up Time for Register Read/Write” in section 3.3.1.

For further information regarding the *I2C_IF_DIS* bit, please refer to the ICM-20649 Register Map and Register Descriptions sections.

6.2 I²C INTERFACE

I²C is a two-wire interface comprised of the signals serial data (SDA) and serial clock (SCL). In general, the lines are open-drain and bi-directional. In a generalized I²C interface implementation, attached devices can be a master or a slave. The master device puts the slave address on the bus, and the slave device with the matching address acknowledges the master.

The ICM-20649 always operates as a slave device when communicating to the system processor, which thus acts as the master. SDA and SCL lines typically need pull-up resistors to VDD. The maximum bus speed is 400 kHz.

The slave address of the ICM-20649 is b110100X which is 7 bits long. The LSB bit of the 7-bit address is determined by the logic level on pin AD0. This allows two ICM-20649s to be connected to the same I²C bus. When used in this configuration, the address of the one of the devices should be b1101000 (pin AD0 is logic low) and the address of the other should be b1101001 (pin AD0 is logic high).

6.3 I²C COMMUNICATIONS PROTOCOL

START (S) and STOP (P) Conditions

Communication on the I²C bus starts when the master puts the START condition (S) on the bus, which is defined as a HIGH-to-LOW transition of the SDA line while SCL line is HIGH (see figure below). The bus is considered to be busy until the master puts a STOP condition (P) on the bus, which is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH (see Figure 8).

Additionally, the bus remains busy if a repeated START (Sr) is generated instead of a STOP condition.

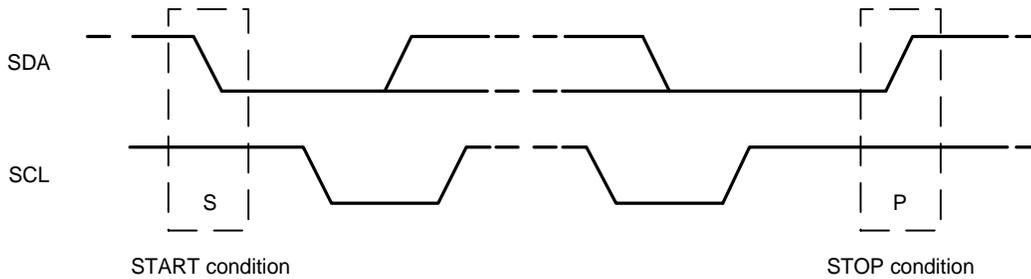

Figure 8. START and STOP Conditions

Data Format / Acknowledge

I²C data bytes are defined to be 8-bits long. There is no restriction to the number of bytes transmitted per data transfer. Each byte transferred must be followed by an acknowledge (ACK) signal. The clock for the acknowledge signal is generated by the master, while the receiver generates the actual acknowledge signal by pulling down SDA and holding it low during the HIGH portion of the acknowledge clock pulse.

If a slave is busy and cannot transmit or receive another byte of data until some other task has been performed, it can hold SCL LOW, thus forcing the master into a wait state. Normal data transfer resumes when the slave is ready, and releases the clock line (refer to Figure 9).

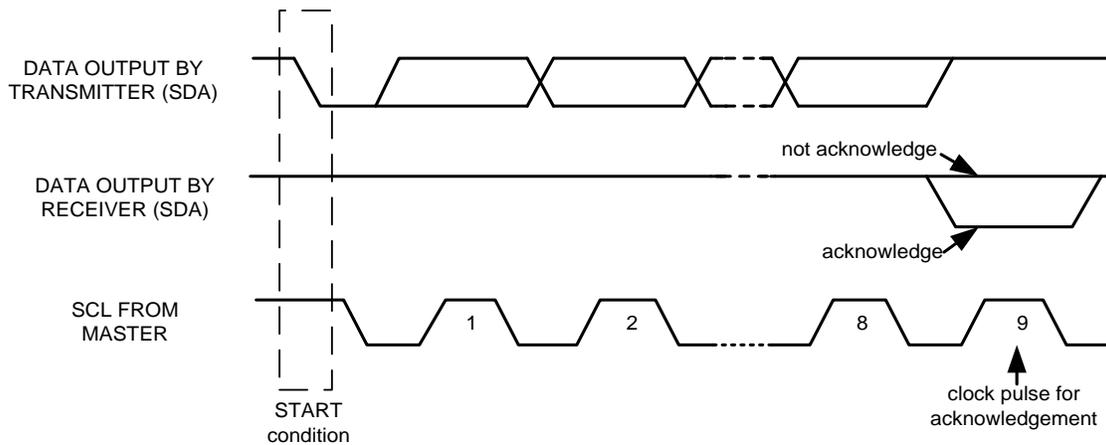

Figure 9. Acknowledge on the I²C Bus

Communications

After beginning communications with the START condition (S), the master sends a 7-bit slave address followed by an 8th bit, the read/write bit. The read/write bit indicates whether the master is receiving data from or is writing to the slave device. Then, the master releases the SDA line and waits for the acknowledge signal (ACK) from the slave device. Each byte transferred must be followed by an acknowledge bit. To acknowledge, the slave device pulls the SDA line LOW and keeps it LOW for the high period of the SCL line. Data transmission is always terminated by the master with a STOP condition (P), thus freeing the communications line. However, the master can generate a repeated START condition (Sr), and address another slave without first generating a STOP condition (P). A LOW to HIGH transition on the SDA line while SCL is HIGH defines the stop condition. All SDA changes should take place when SCL is low, with the exception of start and stop conditions.

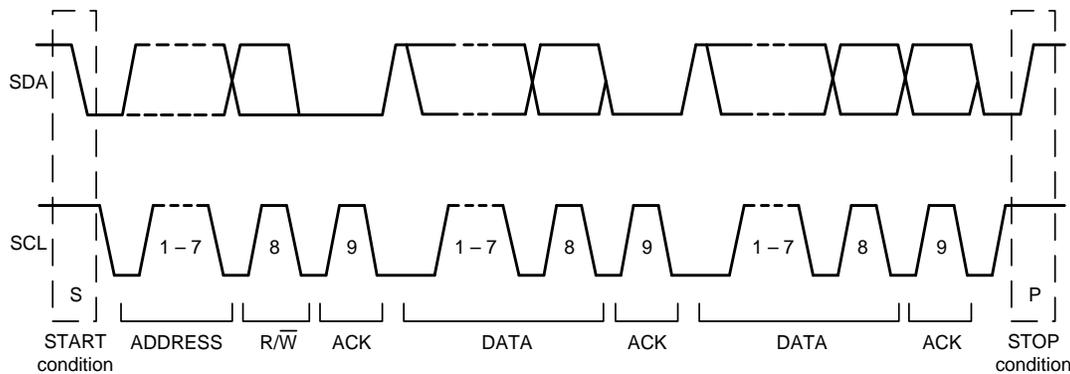

Figure 10. Complete I²C Data Transfer

To write the internal ICM-20649 registers, the master transmits the start condition (S), followed by the I²C address and the write bit (0). At the 9th clock cycle (when the clock is high), the ICM-20649 acknowledges the transfer. Then the master puts the register address (RA) on the bus. After the ICM-20649 acknowledges the reception of the register address, the master puts the register data onto the bus. This is followed by the ACK signal, and data transfer may be concluded by the stop condition (P). To write multiple bytes after the last ACK signal, the master can continue outputting data rather than transmitting a stop signal. In this case, the ICM-20649 automatically increments the register address and loads the data to the appropriate register. The following figures show single and two-byte write sequences.

Single-Byte Write Sequence

Master	S	AD+W		RA		DATA		P
Slave			ACK		ACK		ACK	

Burst Write Sequence

Master	S	AD+W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

To read the internal ICM-20649 registers, the master sends a start condition, followed by the I²C address and a write bit, and then the register address that is going to be read. Upon receiving the ACK signal from the ICM-20649, the master transmits a start signal followed by the slave address and read bit. As a result, the ICM-20649 sends an ACK signal and the data. The communication ends with a not acknowledge (NACK) signal and a stop bit from master. The NACK condition is defined such that the SDA line remains high at the 9th clock cycle. The following figures show single and two-byte read sequences.

Single-Byte Read Sequence

Master	S	AD+W		RA		S	AD+R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Burst Read Sequence

Master	S	AD+W		RA		S	AD+R			ACK		NACK	P

6.4 I²C TERMS

SIGNAL	DESCRIPTION
S	Start Condition: SDA goes from high to low while SCL is high
AD	Slave I ² C address
W	Write bit (0)
R	Read bit (1)
ACK	Acknowledge: SDA line is low while the SCL line is high at the 9 th clock cycle
NACK	Not-Acknowledge: SDA line stays high at the 9 th clock cycle
RA	ICM-20649 internal register address
DATA	Transmit or received data
P	Stop condition: SDA going from low to high while SCL is high

6.5 SPI INTERFACE

SPI is a 4-wire synchronous serial interface that uses two control lines and two data lines. The ICM-20649 always operates as a Slave device during standard Master-Slave SPI operation.

With respect to the Master, the Serial Clock output (SCLK), the Serial Data Output (SDO) and the Serial Data Input (SDI) are shared among the Slave devices. Each SPI slave device requires its own Chip Select (CS) line from the master.

CS goes low (active) at the start of transmission and goes back high (inactive) at the end. Only one CS line is active at a time, ensuring that only one slave is selected at any given time. The CS lines of the non-selected slave devices are held high, causing their SDO lines to remain in a high-impedance (high-z) state so that they do not interfere with any active devices.

SPI Operational Features

1. Data is delivered MSB first and LSB last
2. Data is latched on the rising edge of SCLK
3. Data should be transitioned on the falling edge of SCLK
4. The maximum frequency of SCLK is 7 MHz
5. SPI read and write operations are completed in 16 or more clock cycles (two or more bytes). The first byte contains the SPI Address, and the following byte(s) contain(s) the SPI data. The first bit of the first byte contains the Read/Write bit and indicates the Read (1) or Write (0) operation. The following 7 bits contain the Register Address. In cases of multiple-byte Read/Writes, data is two or more bytes:

SPI Address format

MSB							LSB
R/W	A6	A5	A4	A3	A2	A1	A0

SPI Data format

MSB							LSB
D7	D6	D5	D4	D3	D2	D1	D0

6. Supports Single or Burst Read/Writes.

8 REGISTER DESCRIPTIONS

This section describes the function and contents of each register within the ICM-20649.

Note: The device will come up in sleep mode upon power-up.

8.1 USR BANK 0 REGISTER MAP

8.1.1 WHO_AM_I

Name: WHO_AM_I

Address: 0 (00h)

Type: USR0

Bank: 0

Serial IF: R

Reset Value: 0xE1

BIT	NAME	FUNCTION
7:0	WHO_AM_I[7:0]	Register to indicate to user which device is being accessed. The value for ICM-20649 is 0xE1

8.1.2 USER_CTRL

Name: USER_CTRL

Address: 3 (03h)

Type: USR0

Bank: 0

Serial IF: R/W

Reset Value: 0x00

BIT	NAME	FUNCTION
7	DMP_EN	1 – Enables DMP features. 0 – DMP features are disabled after the current processing round has completed.
6	FIFO_EN	1 – Enable FIFO operation mode. 0 – Disable FIFO access from serial interface. To disable FIFO writes by DMA, use FIFO_EN register. To disable possible FIFO writes from DMP, disable the DMP.
5	I2C_MST_EN	1 – Enable the I ² C Master I/F module; pins ES_DA and ES_SCL are isolated from pins SDA/SDI and SCL/ SCLK. 0 – Disable I ² C Master I/F module; pins ES_DA and ES_SCL are logically driven by pins SDA/SDI and SCL/ SCLK.
4	I2C_IF_DIS	1 – Reset I ² C Slave module and put the serial interface in SPI mode only.
3	DMP_RST	1 – Reset DMP module. Reset is asynchronous. This bit auto clears after one clock cycle of the internal 20 MHz clock.
2	SRAM_RST	1 – Reset SRAM module. Reset is asynchronous. This bit auto clears after one clock cycle of the internal 20 MHz clock.
1	I2C_MST_RST	1 – Reset I ² C Master module. Reset is asynchronous. This bit auto clears after one clock cycle of the internal 20 MHz clock. Note: This bit should only be set when the I ² C master has hung. If this bit is set during an active I ² C master transaction, the I ² C slave will hang, which will require the host to reset the slave.
0	-	Reserved.

8.1.3 LP_CONFIG

Name: LP_CONFIG

Address: 5 (05h)

Type: USR0

Bank: 0

Serial IF: R/W

Reset Value: 0x40

BIT	NAME	FUNCTION
7	-	Reserved.
6	I2C_MST_CYCLE	1 - Operate I ² C master in duty cycled mode. ODR is determined by I2C_MST_ODR_CONFIG register. 0 - Disable I ² C master duty cycled mode.
5	ACCEL_CYCLE	1 - Operate ACCEL in duty cycled mode. ODR is determined by ACCEL_SMPLRT_DIV register. 0 - Disable ACCEL duty cycled mode.
4	GYRO_CYCLE	1 - Operate GYRO in duty cycled mode. ODR is determined by GYRO_SMPLRT_DIV register. 0 - Disable GYRO duty cycled mode.
3:0	-	Reserved.

8.1.4 PWR_MGMT_1

Name: PWR_MGMT_1

Address: 6 (06h)

Type: USR0

Bank: 0

Serial IF: R/W

Reset Value: 0x41

BIT	NAME	FUNCTION										
7	DEVICE_RESET	1 - Reset the internal registers and restores the default settings. Write a 1 to set the reset; the bit will auto clear.										
6	SLEEP	When set, the chip is set to sleep mode (in sleep mode all analog is powered off). Clearing the bit wakes the chip from sleep mode.										
5	LP_EN	The LP_EN only affects the digital circuitry, it helps to reduce the digital current when sensors are in LP mode. Please note that the sensors themselves are set in LP mode by the LP_CONFIG register settings. Sensors in LP mode, and use of LP_EN bit together help to reduce overall current. The bit settings are: 1: Turn on low power feature. 0: Turn off low power feature. LP_EN has no effect when the sensors are in low-noise mode.										
4	-	Reserved.										
3	TEMP_DIS	When set to 1, this bit disables the temperature sensor.										
2:0	CLKSEL[2:0]	<table border="0"> <tr> <td>Code</td> <td>Clock Source</td> </tr> <tr> <td>0</td> <td>Internal 20 MHz oscillator</td> </tr> <tr> <td>1-5</td> <td>Auto selects the best available clock source - PLL if ready, else use the Internal oscillator</td> </tr> <tr> <td>6</td> <td>Internal 20 MHz oscillator</td> </tr> <tr> <td>7</td> <td>Stops the clock and keeps timing generator in reset</td> </tr> </table> <p>Note: CLKSEL[2:0] should be set to 1~5 to achieve full gyroscope performance.</p>	Code	Clock Source	0	Internal 20 MHz oscillator	1-5	Auto selects the best available clock source - PLL if ready, else use the Internal oscillator	6	Internal 20 MHz oscillator	7	Stops the clock and keeps timing generator in reset
Code	Clock Source											
0	Internal 20 MHz oscillator											
1-5	Auto selects the best available clock source - PLL if ready, else use the Internal oscillator											
6	Internal 20 MHz oscillator											
7	Stops the clock and keeps timing generator in reset											

8.1.5 PWR_MGMT_2

Name: PWR_MGMT_2

Address: 7 (07h)

Type: USR0

Bank: 0

Serial IF: R/W

Reset Value: 0x00

BIT	NAME	FUNCTION
7:6	-	Reserved.
5:3	DISABLE_ACCEL	Only the following values are applicable: 111 – Accelerometer (all axes) disabled. 000 – Accelerometer (all axes) on.
2:0	DISABLE_GYRO	Only the following values are applicable: 111 – Gyroscope (all axes) disabled. 000 – Gyroscope (all axes) on.

8.1.6 INT_PIN_CFG

Name: INT_PIN_CFG

Address: 15 (0Fh)

Type: USR0

Bank: 0

Serial IF: R/W

Reset Value: 0x00

BIT	NAME	FUNCTION
7	INT1_ACTL	1 – The logic level for INT1 pin is active low. 0 – The logic level for INT1 pin is active high.
6	INT1_OPEN	1 – INT1 pin is configured as open drain. 0 – INT1 pin is configured as push-pull.
5	INT1_LATCH_EN	1 – INT1 pin level held until interrupt status is cleared. 0 – INT1 pin indicates interrupt pulse is width 50 μ s.
4	INT_ANYRD_2CLEAR	1 – Interrupt status in INT_STATUS is cleared (set to 0) if any read operation is performed. 0 – Interrupt status in INT_STATUS is cleared (set to 0) only by reading INT_STATUS register. This bit only affects the interrupt status bits that are contained in the register INT_STATUS, and the corresponding hardware interrupt. This bit does not affect the interrupt status bits that are contained in registers INT_STATUS_1, INT_STATUS_2, INT_STATUS_3, and the corresponding hardware interrupt.
3	ACTL_FSYNC	1 – The logic level for the FSYNC pin as an interrupt to the ICM-20649 is active low. 0 – The logic level for the FSYNC pin as an interrupt to the ICM-20649 is active high.
2	FSYNC_INT_MODE_EN	1 – This enables the FSYNC pin to be used as an interrupt. A transition to the active level described by the ACTL_FSYNC bit will cause an interrupt. The status of the interrupt is read in the I ² C Master Status register PASS_THROUGH bit. 0 – This disables the FSYNC pin from causing an interrupt.
1	BYPASS_EN	When asserted, the I ² C_MASTER interface pins (ES_CL and ES_DA) will go into 'bypass mode' when the I ² C master interface is disabled.
0	-	Reserved.

8.1.7 INT_ENABLE

Name: INT_ENABLE

Address: 16 (10h)

Type: USR0

Bank: 0

Serial IF: R/W

BIT	NAME	FUNCTION
7	PASS_THROUGH	Status of FSYNC interrupt – used as a way to pass an external interrupt through this chip to the host. If enabled in the INT_PIN_CFG register by asserting bit FSYNC_INT_MODE_EN, this will cause an interrupt. A read of this register clears all status bits in this register.
6	I2C_SLV4_DONE	Asserted when I ² C slave 4's transfer is complete, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted, and if the SLV4_DONE_INT_EN bit is asserted in the I2C_SLV4_CTRL register.
5	I2C_LOST_ARB	Asserted when I ² C slave loses arbitration of the I ² C bus, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
4	I2C_SLV4_NACK	Asserted when slave 4 receives a NACK, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
3	I2C_SLV3_NACK	Asserted when slave 3 receives a NACK, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
2	I2C_SLV2_NACK	Asserted when slave 2 receives a NACK, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
1	I2C_SLV1_NACK	Asserted when slave 1 receives a NACK, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
0	I2C_SLV0_NACK	Asserted when slave 0 receives a NACK, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.

7	I2C_SLV0_EN	1 – Enable reading data from this slave at the sample rate and storing data at the first available EXT_SENS_DATA register, which is always EXT_SENS_DATA_00 for I ² C slave 0. 0 – Function is disabled for this slave.
6	I2C_SLV0_BYTE_SW	1 – Swap bytes when reading both the low and high byte of a word. Note there is nothing to swap after reading the first byte if I2C_SLV0_REG[0] = 1, or if the last byte read has a register address LSB = 0. For example, if I2C_SLV0_REG = 0x1, and I2C_SLV0 LENG = 0x4: 1) The first byte read from address 0x1 will be stored at EXT_SENS_DATA_00, 2) The second and third bytes will be read and swapped, so the data read from address 0x2 will be stored at EXT_SENS_DATA_02, and the data read from address 0x3 will be stored at EXT_SENS_DATA_01, 3) The last byte read from address 0x4 will be stored at EXT_SENS_DATA_03 0 – No swapping occurs; bytes are written in order read.
5	I2C_SLV0_REG_DIS	When set, the transaction does not write a register value, it will only read data, or write data
4	I2C_SLV0_GRP	External sensor data typically comes in as groups of two bytes. 9 USE NOTES

9.1 GYROSCOPE MODE TRANSITION

When gyroscope is transitioning from standard to low-noise mode, several unsettled output samples will be observed at the gyroscope output due to filter switching and settling. The number of unsettled gyroscope output samples depends on the filter and ODR settings.

9.2 POWER MANAGEMENT 1 REGISTER SETTING

CLKSEL[2:0] has to be set to 001 to achieve the datasheet performance.

9.3 DMP MEMORY ACCESS

Reading/writing DMP memory and FIFO through I²C in a multithreaded environment can cause wrong data being read. To avoid the issue, one may use SPI instead of I²C, or use I²C with mutexes.

9.4 TIME BASE CORRECTION

The system clock frequency at room temperature in gyroscope mode and 6-Axis mode varies from part to part, and the clock rates specified in datasheet are the nominal values. The percentage of frequency deviation from the nominal values for each part is logged in register TIMEBASE_CORRECTION_PLL, and the range of the code is $\pm 10\%$ with each LSB representing a step of 0.079%. For example, if on one part TIMEBASE_CORRECTION_PLL = 0x0C = d'12, it means the clock frequency in gyroscope mode and 6-Axis mode is $\sim 0.94\%$ faster than the nominal value.

When operating in accelerometer-only mode, the system clock frequency at room temperature is the nominal frequency over parts, and it is independent of the value stored in TIMEBASE_CORRECTION_PLL register.

9.5 I²C MASTER CLOCK FREQUENCY

I²C master clock frequency can be set by register I2C_MST_CLK as shown in the table below. Due to temperature variation and part to part variation of system clock frequency in different power modes, I2C_MST_CLK should be set such that in all conditions the clock frequency will not exceed what a slave device can support. To achieve a targeted clock frequency of 400 kHz, MAX, it is recommended to set I2C_MST_CLK = 7 (345.6 kHz / 46.67% duty cycle).

I2C_MST_CLK	Nominal CLK Frequency [kHz]	Duty Cycle
0	370.29	50.00%

Table 19. I²C Master Clock Frequency

9.6 CLOCKING

The internal system clock sources include: (1) an internal relaxation oscillator, and (2) a PLL with MEMS gyroscope oscillator as the reference clock. With the recommended clock selection setting (CLKSEL = 1), the best clock source for optimum sensor performance and power consumption will be automatically selected based on the power mode. Specifically, the internal relaxation oscillator will be selected when operating in accelerometer only mode, while the PLL will be selected whenever gyroscope is on, which includes gyroscope and 6-axis modes.

As clock accuracy is critical to the preciseness of distance and angle calculations performed by DMP, it should be noted that the internal relaxation oscillator and PLL show different performances in some aspects. The internal relaxation oscillator is trimmed to have a consistent operating frequency at room temperature, while the PLL clock frequency varies from part to part. The PLL frequency deviation from the nominal value in percentage is captured in register TIMEBASE_CORRECTION_PLL, and users can factor it in during distance and angle calculations to not sacrifice accuracy. Other than that, PLL has better frequency stability and lower frequency variation over temperature than the internal relaxation oscillator.

9.7 LP_EN BIT-FIELD USAGE

The LP_EN bit-field (User Bank 0, PWR_MGMT_1 register, bit [5] helps to reduce the digital current. The recommended setting for this bit-field is 1 to achieve the lowest possible current. However, when LP_EN is set to 1, user may not be able to write to the following registers. If it is desired to write to registers in this list, it is recommended to first set LP_EN=0, write the desired register(s), then set LP_EN=1 again:

- USER BANK 0: All registers except LP_CONFIG, PWR_MGMT_1, PWR_MGMT_2, INT_PIN_CFG, INT_ENABLE, FIFO_COUNTH, FIFO_COUNTL, FIFO_R_W, FIFO_CFG, REG_BANK_SEL
- USER BANK 1: All registers except REG_BANK_SEL
- USER BANK 2: All registers except REG_BANK_SEL
- USER BANK 3: All registers except REG_BANK_SEL

9.8 REGISTER ACCESS USING SPI INTERFACE

Using the SPI interface, when the AP/user disables the gyroscope sensor (User Bank 0, PWR_MGMT_2 register, bits [2:0]=111) as part of a sequence of register read or write commands, the AP/user will be required to subsequently wait 22 μ s prior to any of the following operations:

(1) Writing to any of the following registers:

- USER BANK 0: All registers except LP_CONFIG, PWR_MGMT_1, PWR_MGMT_2, INT_PIN_CFG, INT_ENABLE, FIFO_COUNTH, FIFO_COUNTL, FIFO_R_W, FIFO_CFG, REG_BANK_SEL
- USER BANK 1: All registers except REG_BANK_SEL
- USER BANK 2: All registers except REG_BANK_SEL
- USER BANK 3: All registers except REG_BANK_SEL

(2) Reading data from FIFO

(3) Reading from memory
