

## Wideband Amplifier DC - 50 GHz

Rev. V2

### Features

- 15 dB Gain
- 50  $\Omega$  Input / Output Match
- +20 dBm Output Power
- +5 V DC, 190 mA
- Die size: 1.97 x 1.30 x 0.1 mm
- Gold-Plated Contact Pads, Backside
- 100% On-Wafer DC & RF Tested
- RoHS\* Compliant

### Description

The MAAM-011109-DIE is an easy-to-use, wideband amplifier that operates from DC - 50 GHz. This device features 15 dB gain and +20 dBm of output power. Matching is 50  $\Omega$  with typical return loss better than 15 dB. This amplifier requires dual DC power supplies: 5V (190 mA) and a low current negative VG1 (< 1 mA).

Features include gate bias adjust to change current setting for power or temperature, gain trim control that allows 15 dB of gain control (0 to -1 V), and a temperature-compensated detector that provides a DC voltage in relation to the output power.

The MAAM-011109-DIE is ideally suited for any application that requires 50  $\Omega$  gain from DC to 50 GHz. It is useful in circuits where the incoming signal varies over a broad bandwidth such as laboratory, instrumentation, and defense applications.

### Ordering Information<sup>1</sup>

Part Number	Package
MAAM-011109-DIE	Die in Gel Pack

1. Die quantity varies.

### Functional Schematic

### Pad Configuration<sup>2,3</sup>

Pin No.	Pin Name	Function
1	IN	RF Input (alternate gate bias)
2	VG1	Gate Voltage (negative)
3	VC2	Gain Control (alternate)
4	OUT	RF Output (drain bias)
5	N/C	Do Not Use
6	N/C	Do Not Use
7	VDET	Power Detector
8	VD	Bypass (alternate drain bias)
9	VD1	Alternate Bypass
10	VC	Gain Control
G		Ground

2. See Application Information for biasing details.

3. The backside of the die must be connected to RF, DC and thermal ground.

### Electrical Specifications<sup>4</sup>:

$T_A = +25^\circ\text{C}$ ,  $+5\text{ V}$  (applied to OUT),  $V_{G1} = -0.4\text{ V}$ ,  $V_C = \text{Open}$ ,  $Z_{IN} = Z_{OUT} = 50\ \Omega$

Parameter	Test Conditions	Units	Min.	Typ.	Max.
Gain	10 KHz - 2 GHz	dB	—	15.5	—
	2 - 40 GHz		14.0	15.5	
	50 GHz		—	12	
Isolation	DC - 50 GHz	dB	—	22	—
Input Return Loss	DC - 50 GHz	dB	—	15	—
Output Return Loss	DC - 20 GHz	dB	—	15	—
	20 - 50 GHz			9	
Noise Figure	DC - 40 GHz	dB	—	3.5	—
P1dB	0.1 GHz	dBm	—	21	—
	10 GHz			21	
	40 GHz			15	
Output IP3	0.1 GHz	dBm	—	29	—
	10 GHz			29	
	40 GHz			19	
Bias Current	—	mA	—	190	—

4. See Application Information for biasing details.

### Absolute Maximum Ratings<sup>5,6</sup>

Parameter	Absolute Maximum
Input Power	17 dBm
Drain Voltage	7.5 V
Drain Current	240 mA
Control Voltage	$-1\text{ V} \leq V_C \leq 1.2\text{ V}$
Junction Temperature <sup>7,8</sup>	$+150^\circ\text{C}$
Operating Temperature	$-40^\circ\text{C}$ to $+85^\circ\text{C}$
Storage Temperature	$-65^\circ\text{C}$ to $+150^\circ\text{C}$

5. Exceeding any one or combination of these limits may cause permanent damage to this device.
6. MACOM does not recommend sustained operation near these survivability limits.
7. Operating at nominal conditions with  $T_J \leq +150^\circ\text{C}$  will ensure  $\text{MTTF} > 1 \times 10^6$  hours.
8. Junction Temperature ( $T_J$ ) =  $T_C + \Theta_{jc} * (V * I)$   
Typical thermal resistance ( $\Theta_{jc}$ ) =  $17.8^\circ\text{C/W}$ .
  - a) For  $T_C = 25^\circ\text{C}$ ,  
 $T_J = 47^\circ\text{C}$  @ 6.5V, 190mA
  - b) For  $T_C = 85^\circ\text{C}$ ,  
 $T_J = 107^\circ\text{C}$  @ 6.5V, 190mA

### Handling Procedures

Please observe the following precautions to avoid damage:

### Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these Class 1A devices.

### Biasing Schematic

### Application Schematic (recommended biasing)

### Parts List

Part	Value	Case Style
C1	> 150 pF	0201 or parallel plate
C2	> 150 pF	0201 or Parallel plate

### Application Information (DC & Pads)

For proper operation a DC voltage must be applied to the VG1 (typically -0.4 V) and OUT (typically +5 V) pads *in that order*. Note that the Biasing Schematic shows ESD diodes connected to the VC and VG1 pads (the notation (4) on the VC pad indicates there are four forward diodes in series and the (2) on the VG1 pad diode indicates there are two reverse diodes in series).

Adjusting VG1 from -1.0 to -0.2 V will increase the quiescent current. Alternatively the positive bias may be connected to the VD pin. When the positive bias is connected to the VD pin the current must be less than 100 mA and it should be noted that the actual operating voltage for the gain stages will be  $VD - 35 ID$ . The actual operating voltage should be kept between 3.3 and 6.5 V for proper operation.

The VG1 and VD pads should be bypassed with 0.22  $\mu$ F for flattest overall low end response. Best flatness for 1 GHz and above will be achieved by bypassing the VD1 pad, instead of the VD pad, with at least 150 pF and a total trace plus bondwire inductance of 2.5 nH, and the VG1 pad with at least 150 pF.

The VC pad is typically left unconnected unless gain control or output power limiting is desired. Please refer to the "Variable Gain/Limiting" section for detailed usage. The VDET pad is typically left unconnected unless a voltage indication of the output power is required. Please refer to the "Internal Detector" section for detailed usage.

### Bandwidth, Power, Noise and Linearity

Bias voltage and current affect both the bandwidth (response flatness), power available, noise figure, and linearity of the amplifier. Higher currents and lower bias voltage increase high frequency gain but reduce the P1dB and the OIP3 numbers. If the device is driven to P1dB and on into Psat the bias current will naturally reduce. The device will return to the quiescent current value once the input power is reduced. Finally, higher bias current values increase the device noise figure.

Temperature also affects the bandwidth, gain and noise figure of the device. Lower temperatures increase gain and bandwidth but reduce the noise figure. Temperature has little effect on power and linearity.

## Outline Drawing

## Bond Pad Detail in $\mu\text{m}$

Pad	Size (x)	Size (y)
A	85	65
B	85	65
C	135	80
D	135	80
E	135	80
F	135	85
G	85	135
H	135	70
J	65	105
K	85	135
GND	78	91

### Notes:

1. All units are in  $\mu\text{m}$ , unless otherwise noted, with a tolerance of  $\pm 5 \mu\text{m}$ .
2. Die thickness is  $100 \pm 10 \mu\text{m}$ .

## Broadband Amplifier Applications

The MAAM-011109-DIE also has a low enough noise figure to be used in instrumentation front ends and buffer applications. It also has very flat response with low group delay distortion so it can be used in pulse applications. For higher gains multiple amplifiers may be cascaded. It also makes a very good low cost optical driver capable of delivering up to 8 V p-p into 50 ohms.

## Variable Gain/Limiting Applications

The gain of the MAAM-011109-DIE can be easily controlled with the VC pin. The gain reduction is almost linear with VC between 0.1 V to -0.8 V. Below -0.7 V internal ESD protection diodes will draw increasing current (50 mA at -1.0 V). The VC pad should not be driven below -1 V or above 1.2 V. The nominal open circuit voltage at the VC pad is 0.8 V.

Reducing VC below 0.8 V will also reduce the bias current. Gain, P1dB, and PSAT will all be reduced as the voltage on VC is lowered. Limiting applications and zero crossing adjustment can be done by adjusting the VG1 and VC pads together.

## Internal Detector

The VDET pad is connected to an internal diode detector. This pad should be connected to a high impedance ( $>50\text{ k}\Omega$ ) or left unconnected. The detector is internally connected so that it responds predominately to the power generated by the amplifier and is temperature compensated. The detector has a low pass characteristic which rolls off gradually above 1 GHz. Finally, even with zero output power the detector has a DC output voltage proportional to the bias voltage (nominally 2.8 V for 5 V at the OUT pad).
