

Absorptive High Isolation SPDT Switch with Negative Voltage Generator Shutdown, 5MHz to 6000MHz

The RFSW6224 is a Silicon on Insulator (SOI) single-pole, double throw (SPDT) switch designed for use in cellular, 3G, LTE, and other high performance communications systems. It offers a high isolation symmetric topology with excellent linearity and power handling capability. No blocking caps are necessary on the RF ports. The design is non-reflective such that RF ports 1 and 2 are terminated in the off-state. The V_{EN} pin allows for a terminated "alloff state". The V_{SD} pin will turn the negative voltage generator off and allow for external negative supply input on the V_{NEG} pin.

High Control Voltage (VCTL)	1.1		VDD	V	

Notes:

- 1. S-parameters have the PCB de-embedded
- 2. RF ports need to be at 0V DC. If voltage is present on RF lines, blocking caps are required.

Notes:

- 1. Assuming load VSWR <3:1, for high VSWR loads, this value reduces to 30.5dBm
- 2. Applies to resistive loss from insertion loss not including mismatch loss
- 3. Total power in both loads being driving simultaneously
- 4. For <300MHz, it is recommended to operate at least 4dB below 1dB compression point
