About Microsemi

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.

1 Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

1.1 Revision 3.1

Libero SoC software license information was updated from Platinum to Gold. For more information, see [Table 1](#), page 2 and [Software Settings](#), page 6.

1.2 Revision 3.0

The following was a summary of the changes in revision 3.0 of this document.

- Throughout the document, figures were updated in accordance with revision E of the SmartFusion2 M2S090TS-EVAL-KIT.
- Information about jumper settings was updated. For more information, see [Jumper Settings](#), page 6 and [Validating Power Supply](#), page 40.
- Information about the LPDDR SDRAM interface was updated. For more information, see [LPDDR SDRAM](#), page 11.
- Information about programming the device for the manufacturing test was updated. For more information, see [Programming the FPGA Using Embedded FlashPro5](#), page 40.

1.3 Revision 2.0

Updated LPDDR resolution changes (SAR 52540, SAR 57285, SAR 61490, SAR 53271).

1.4 Revision 1.0

Revision 1.0 was the first publication of this document.

2 Introduction

The RoHS-compliant SmartFusion®2 SoC FPGA Security Evaluation Kit (M2S090TS-EVAL-KIT) enables you to develop the following types of applications:

- Data security
- Motor control
- System management
- Industrial automation
- High-speed serial I/O applications:
 - Peripheral component interconnect express (PCIe)
 - Serial-gigabit media independent interface (SGMII)
 - User-customizable serial interfaces

2.1 Kit Contents

The following table lists the contents of the M2S090TS-EVAL-KIT.

Table 1 • Kit Contents

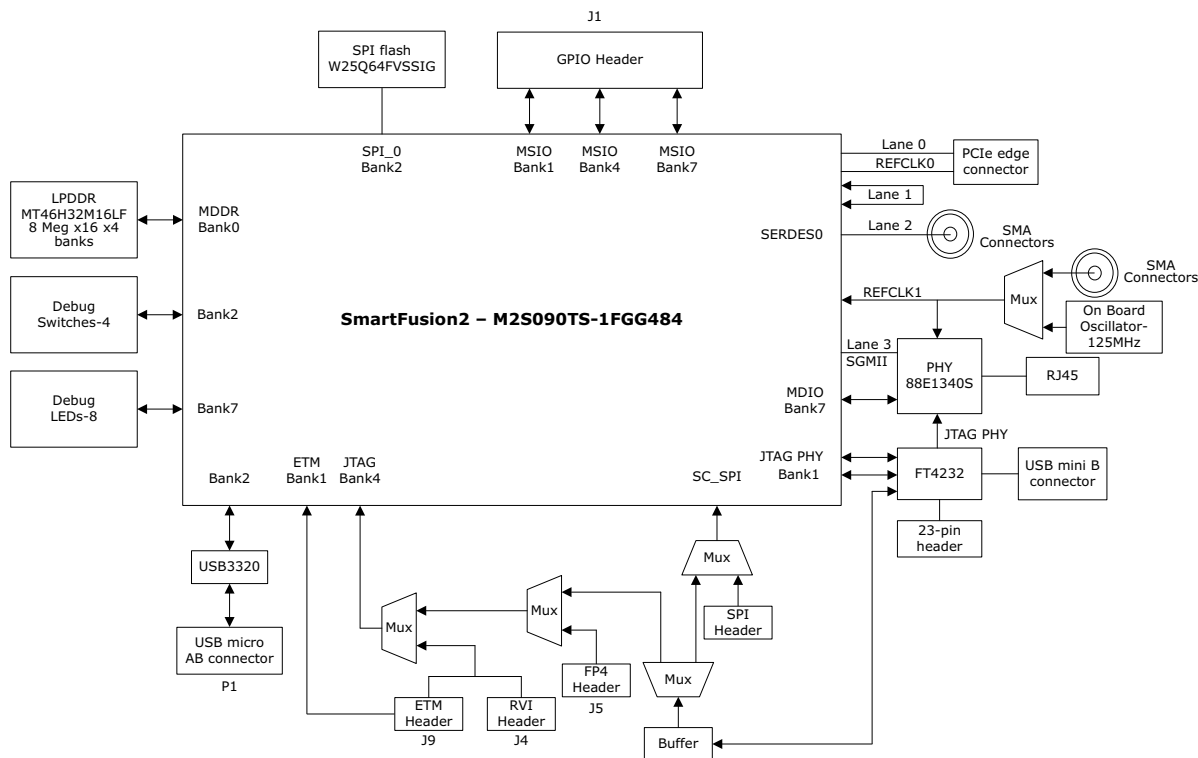

Item	Quantity
SmartFusion2 Security Evaluation Board with the 90 K LE M2S090TS-1FGG484 device	1
12 V/2 A wall-mounted power adapter	1
FlashPro4 JTAG programmer	1
USB 2.0 A male to mini-USB B cable for UART/power interface (up to 1 A) to PC	1
Quickstart card	1
Free one-year Libero SoC Gold software license	1
PCIe control plane demo design pre-programmed on the device	1

Note: The SmartFusion2 device can be programmed either using the on-board SPI slave (FlashPro5) programmer or using the external FlashPro4 programmer. SoftConsole debugging cannot be performed in SPI slave mode. FlashPro4 is required to develop and debug embedded applications using SoftConsole, Identity, or SmartDebug.

2.2 Block Diagram

The following figure is the block diagram of the SmartFusion2 Security Evaluation Kit.

Figure 1 • SmartFusion2 Security Evaluation Kit Block Diagram

2.3 Web Resources

For more information about the M2S090TS-EVAL-KIT, see www.microsemi.com/products/fpga-soc/design-resources/dev-kits/SmartFusion2/smartfusion2-evaluation-kit#overview.

2.4 Board Description

The M2S090TS-EVAL-KIT offers a full-featured evaluation board for SmartFusion2 SoC FPGAs. The board integrates the following features on a single chip.

- Reliable flash-based FPGA fabric
- 166 MHz ARM Cortex-M3 processor
- Advanced security processing accelerators
- Digital signal processing (DSP) blocks
- Static random-access memory (SRAM)
- Embedded non-volatile memory (eNVM)
- High-performance communication interfaces

The SmartFusion2 Security Evaluation Board has several standard interfaces, including.

- An RJ45 connector for 10/100/1000 Mbps Ethernet
- A full-duplex serializer/deserializer (SerDes) lane connected through sub-miniature version A (SMA) connectors
- A 64-bit GPIO header
- Various connectors for serial peripheral interface (SPI) support

The SmartFusion2 memory management system supports 512 Mb on-board low-power double data rate (LPDDR) SDRAM memory and 64 Mb SPI flash memory. The SerDes block can either be accessed using the PCIe edge connector or using high-speed SMA connectors.

The printed circuit board (PCB) supports the M2S090TS device in an FGG484 package. It has eight layers and is manufactured with FR4 dielectric material.

The following figure is a snapshot of the SmartFusion2 Security Evaluation Board with its engineering silicon.

Figure 2 • SmartFusion2 Security Evaluation Board

Note: Microsemi recommends using a 12-inch SMA Male to SMA Male Precision Cable using the RoHS-compliant PE-SR405FLJ coax with the SmartFusion2 Security Evaluation Kit. For more information, see www.pasternack.com/sma-male-sma-male-pe-sr405flj-cable-assembly-pe39429-12-p.aspx.

2.5 Board Key Components

The following table lists key components of the SmartFusion2 Security Evaluation Kit.

Table 2 • SmartFusion2 Security Evaluation Kit Components

Name	Description
SmartFusion2 FPGA	M2S090TS-1FGG484 FPGA with data security feature.
On-board 125 MHz clock oscillator	125 MHz clock oscillator with differential output.
x1 PCIe edge connector	PCIe edge connector with one lane.
Switches (SW1, SW2, SW3, and SW4)	Push-button switches for user interface debugging applications.
SerDes reference clock connectors	J17 and J21. External clock is sourced through SMA connectors.
Micro-USB OTG	P1. Micro-AB USB connector, interfacing with the high-speed USB 2.0 ULPI transceiver chip, USB3320, which, in turn, interfaces with FPGA pins of the SmartFusion2 MSS.

Table 2 • SmartFusion2 Security Evaluation Kit Components (continued)

Name	Description
USB-UART terminal	J18. FTDI programmer interface to program the external SPI flash.
10/100/1000 Ethernet RJ45 connector	J13. RJ45 connector (Ethernet jack with built-in magnetics) interfacing with Marvell 10/100/1000 BASE-T PHY chip, 88E1340S, in SGMII mode. 88E1340S, which, in turn, interfaces with the Ethernet port of the SmartFusion2 MSS (on-chip MAC and external PHY).
12 V power supply input	J6. The board is powered by a 12 V power source using an external +12 V/2 A DC jack.
On/Off switch	SW7. Power ON or OFF switch from +12 V external DC jack.
50 MHz oscillator	50 MHz clock oscillator.
Low-power DDR (LPDDR)	512 Mb (MT46H32M16LF - 8 Meg × 16 × 4 banks) for storing data bits.
GPIO header	J1. General purpose input/output (GPIO) header for multi-standard I/O (MSIO) signals to be routed.
SW5	Four DIP switches for testing and navigation.
Light-emitting diodes (LEDs)	Eight active-low LEDs connected to some of the user I/Os for debugging, and three active high LEDs used for indicating power supply.
JTAG programming header	J5. The SmartFusion2 device in the evaluation kit can be programmed using FlashPro4. J5 is the programming header for FlashPro4 to program and debug the SmartFusion2 device.
Reset switch	SW6. Push-button system reset for the SmartFusion2 device.
Embedded trace macro (ETM) debug header	J9. ETM header for debugging.
RVI/IAR debug header	J4. RVI header for application programming and debugging with Keil ULINK or IAR J-Link.
Tx/Rx SerDes SMA pairs	J10. SERDES0 TXD2 P. J15. SERDES0 TXD2 N. J16. SERDES0 RXD2 P. J20. SERDES0 RXD2 N.
I2C header	H1. Two I2C ports routed to header.
Current measurement	TP14. 1.2 V current sensing test point (TP).
SPI flash	64 Mb SPI flash Winbond Electronics W25Q64FVSSIG connected to SPI port 0 of the SmartFusion2 microcontroller subsystem (MSS).
LP crystals	Y4 and Y5. 32.768 KHz crystal oscillators.

3 Installation and Settings

This section provides information about the software and hardware settings required to run the pre-programmed demo design in the SmartFusion Security Evaluation Kit.

3.1 Software Settings

Download and install the latest release of Microsemi Libero® SoC software v11.5 or later from the Microsemi website, and register for a free one-year Gold license to the software. The Libero SoC v11.5 or later installer has FlashPro4 drivers. For instructions on how to install Libero SoC and SoftConsole, see the [Libero Installation and Licensing Guide](#).

For instructions about how to download and install Microsemi DirectCores, SGCores, and driver firmware cores, which must be installed on the PC where Libero SoC is installed, see [Installing IP Cores and Drivers User Guide](#).

3.2 Hardware Settings

This section provides information about jumper settings, switches, LEDs, and DIP switches in the pre-programmed demo design in the M2S090TS-EVAL-KIT.

3.2.1 Jumper Settings

Connect the jumpers with the settings specified in the following table to evaluate the pre-programmed demo design.

Table 3 • Jumper Settings for Pre-Programmed Demo Design

Jumper	Description	Pin	Default Setting
J23	Jumper to select switch-side MUX inputs of A or B to the line side	Pin 1-2 (Input A to the line side) that is on board 125 MHz differential clock oscillator output will be routed to line side	Closed
		Pin 2-3 (Input B to the line side) that is external clock required to source through SMA connectors to the line side	Open
J22	Jumper to select the output enable control for the line side outputs	Pin 1-2 (line-side output enabled)	Closed
		Pin 2-3 (line-side output disabled)	Open
J24	Jumper to provide the VBUS supply to USB when using in host mode	–	Open
J8	JTAG selection jumper to select between RVI header or FlashPro4 header for application debug	Pin 1-2 FP4 for SoftConsole/FlashPro	Closed
		Pin 2-3 RVI for Keil ULINK/IAR J-Link	Open
		Pin 2-4 for toggling JTAG_SEL signal remotely using the GPIO capability of the FT4232 chip	Open
J3	Jumpers to select either the SW2 input or the ENABLE_FT4232 signal from the FT4232H chip	Pin 1-2 for manual power switching using SW7	Closed
		Pin 2-3 for remote power switch using the GPIO capability of the FT4232 chip	Open
J31	Jumper to select between FTDI JTAG programming and FTDI slave programming	Pin 1-2 for FlashPro FTDI JTAG programming	Closed
		Pin 2-3 for SPI slave programming	Open

Table 3 • Jumper Settings for Pre-Programed Demo Design (continued)

Jumper	Description	Pin	Default Setting
J32	Jumper to select between FTDI SPI and SC_SCI header	Pin 1-2 for programming through the FTDI SPI	Closed
		Pin 2-3 for Programming through the SC_SPI header	Open
J35	Jumper to select between FP4 header and FTDI JTAG	Pin 1-2 for programming through the FP4 header	Closed
		Pin 2-3 for programming through FTDI JTAG	Open

For locations of various jumpers and test points on the SmartFusion2 Security Evaluation Board, see [Figure 18](#), page 37 and [Figure 19](#), page 38.

3.2.2 LEDs

The following table lists the power supply and Ethernet LEDs in the pre-programmed demo design.

Table 4 • LEDs in the Pre-Programmed Demo Design

LED	Description
DS1 - Green	5 V rail
DS2 - Green	3.3 V rail
DS3 - Green	12 V power source
DS5 - Green	Connected to parallel LED output port 0 (P0_LED[0]) of Marvell PHY
DS4 - Green	Connected to parallel LED output port 0 (P0_LED[2]) of Marvell PHY
DS6 - Green	Connected to parallel LED output port 0 (P0_LED[3]) of Marvell PHY

3.2.3 Test Points

The following table lists USB, ground, and other test points for the pre-programmed demo design.

Table 5 • Test Points for the Pre-Programmed Demo Design

Test Point	Description
TP8	USB switch I/O for DP signal
TP9	USB switch I/O for DM signal
TP1, TP2, TP4, TP5, TP6, TP7, TP10, TP11	Ground
TP3	Test point for DDR_VTT
TP12	Test point to measure the voltage at TP12 with reference to ground
TP14	1.2 V current-sensing test point
TP15	1.8 V current-sensing test point
TP16, TP17	Test points across current sense resistor 0.05 Ω for 1.2 V
TP18, TP19	Test points across current sense resistor 0.05 Ω for 1.8 V

3.3 Power Sources

All the power supply devices used in the SmartFusion2 Security Evaluation Kit are Microsemi devices. For more information about power supply devices, go to www.microsemi.com/product-directory/ics/853-power-management.

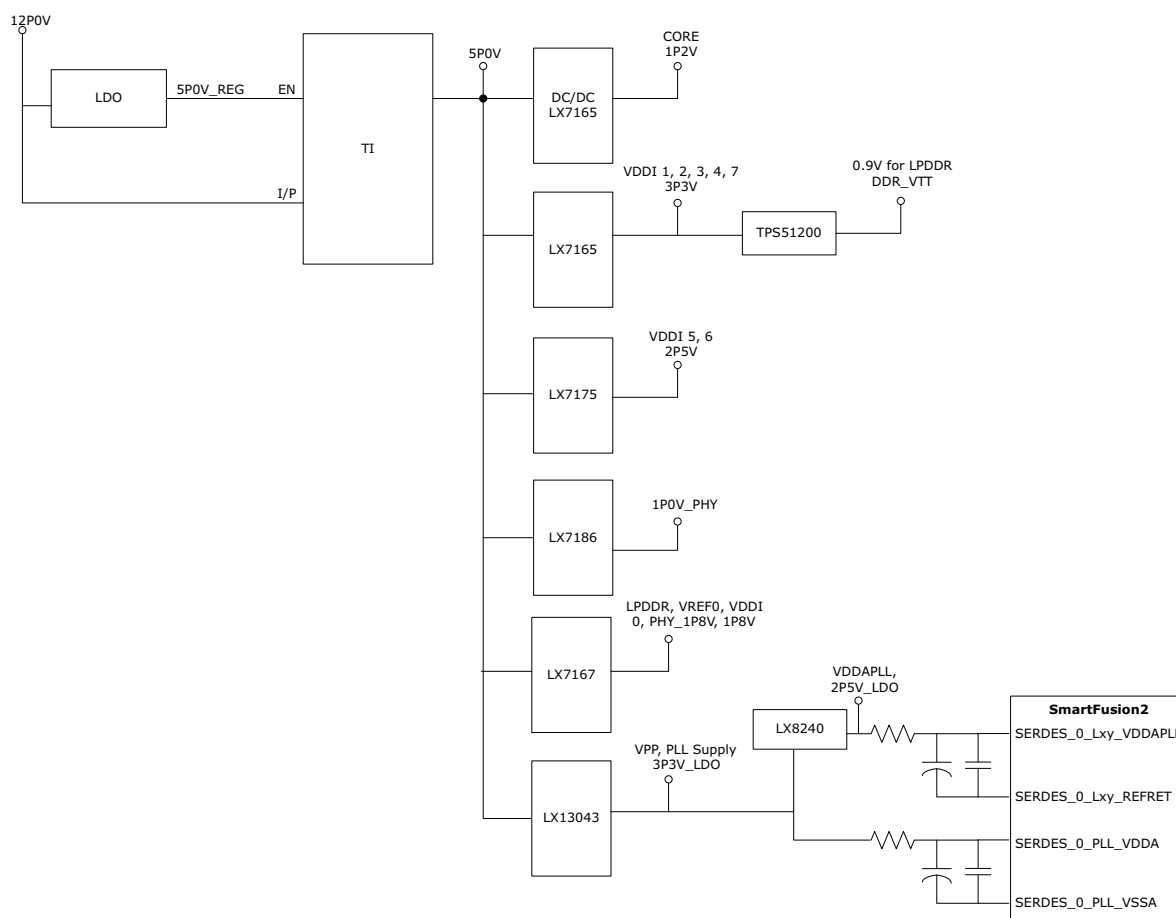

The following table lists the key power supplies required for normal operation of the SmartFusion2 Security Evaluation Kit.

Table 6 • I/O Voltage Rails

SmartFusion2 Bank	I/O Rail	Voltage
Bank 0	VDDI0	1.8 V
Bank 2	VDDI2	3.3 V
Bank 3	VDDI3	3.3 V
Bank 4	VDDI4	3.3 V
Bank 5	VDDI5	3.3 V
Bank 6	VDDI6	2.5 V
Bank 7	VDDI7	2.5 V
Bank 8	VDDI8	3.3 V

The following figure shows voltage rails (12 V, 5 V, 3.3 V, 2.5 V, 1.8 V, 1.5 V, and 1.0 V) available in the SmartFusion2 Security Evaluation Kit.

Figure 3 • Voltage Rails in SmartFusion2 Security Evaluation Kit

4 Key Components Description and Operation

This section describes the key component interfaces of the SmartFusion2 Security Evaluation Kit. For device datasheets, go to <http://www.microsemi.com/products/fpga-soc/design-resources/dev-kits/smartfusion2-kits>.

4.1 Powering Up the Board

The SmartFusion2 Security Evaluation Board is powered using either of the two 12 V power sources—the external +12 V/2 A DC jack or the PCIe connector, as shown in the following figure. Protection mechanism enables the external DC jack supply.

When both the power sources are ON, the board draws power from the external DC jack as diode D3 becomes reverse-biased and the path is let open for 12P0_PCIE. When external DC voltage is not present, the board can be powered up using the PCIe connector.

The following figure shows the power-up flow for the SmartFusion2 Security Evaluation Board.

Figure 4 • Powering Up the Board

4.2 Current Measurement

This section provides information about current sensing in various modes.

4.2.1 1.2 V Current Sensing for Normal Operation

For applications that require current measurement, high-precision operational amplifier circuitry (U31 with gain 100) is provided on the board to measure the output voltage at the **TP14** test point.

The following steps describe how to measure the core power:

1. Measure the output voltage (V_{OUT}) at TP14.
2. $I = (V_{OUT}/5)$.
3. Core power consumed (P) = $(1.2 \text{ V}) \times I$.

For example, when the voltage measured across TP14 is 0.5 V, the core power consumed is 0.12 W.

The following figure shows the on-board core power measurement circuitry.

Figure 5 • Core Power Measurement Circuitry

4.2.2 1.2 V Current Sensing for Flash*Freeze

The SmartFusion2 device consumes very less power in Flash*Freeze mode. The voltage across the sense resistor (0.05 Ω) must be measured directly using a precision digital multimeter that can read sub-millivolts. The **TP16** and **TP17** test points can be used to directly measure the voltage across the 1.2 V sense resistor.

To convert the voltage measured across a sense resistor to power, use the following equation:

$$\text{Power} = \left(\frac{\text{voltage_in_millivolts}}{0.05} \right) \times 1.2$$

Note: Accuracy is ± 10%.

4.2.3 1.8 V Current Sensing

For applications that require current measurement, high-precision operational amplifier circuitry (U32 with gain 100) is provided on the board to measure the output voltage at the **TP15** test point.

The following steps describe how to measure the core power:

1. Measure the output voltage (V_{OUT}) at TP15.
2. $I = (V_{OUT}/5)$.
3. Core power consumed (P) = $(1.8 \text{ V}) \times I$.

For example, when the voltage measured across TP15 is 0.5 V, the power consumed is 0.18 W.

The following figure shows the on-board 1.8 V power measurement circuitry.

Figure 6 • 1.8 V Power Measurement Circuitry

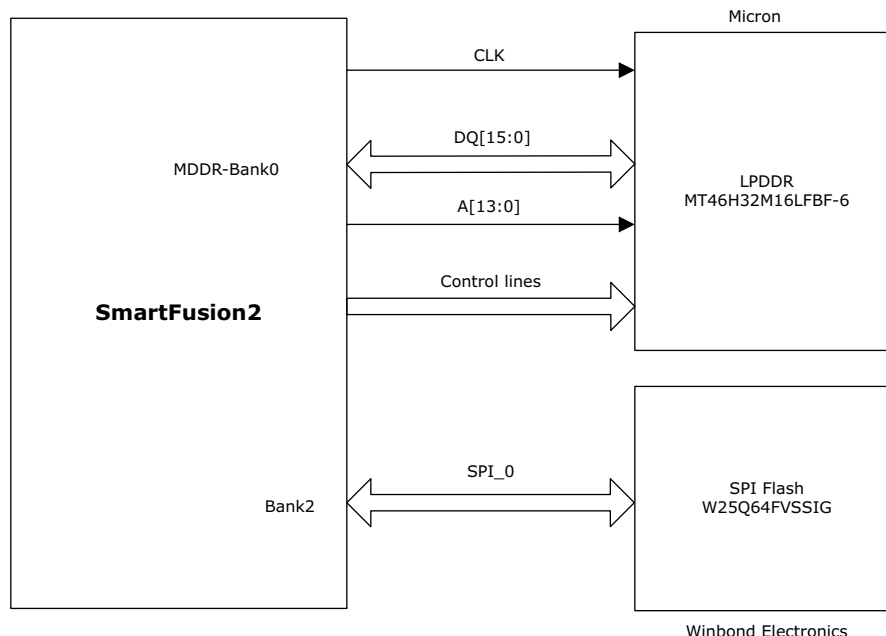

Note: Accuracy is ± 10%.

4.3 Memory Interface

Dedicated I/Os for MSS DDR and fabric DDR are available in the SmartFusion2 device. In addition to dedicated I/Os, regular I/Os can also be used to connect to other memory devices, as shown in the following figure.

Figure 7 • SmartFusion2 Memory Interface

4.3.1 LPDDR SDRAM

An individual chip with 512 Mb LPDDR SDRAM is provided in the SmartFusion2 device to serve as flexible volatile memory for user applications. The LPDDR interface is implemented in bank 0.

LPDDR SDRAM specifications for the SmartFusion2 device are as follows:

- MT46H32M16LF: 8 Meg × 16 × 4 banks
- Density: 512 Mb
- Data rate: LPDDR 16-bit at 166 MHz clock rate

The SmartFusion2 Security Evaluation Kit design uses the LPDDR and LVCMOS18 standards for the LPDDR interface. The default board assembly available for the LPDDR standard has RC terminations. The LVCMOS18 I/O standard has lower power characteristics than the LPDDR (SSTL18) standard for the LPDDR memories. To achieve low power characteristics (LPDDR in LVCMOS18 mode), change the I/O type in the design example to LVCMOS18.

For more information, see the Board Level Schematics document (provided separately).

4.3.2 SPI Serial Flash

SPI flash specifications for the SmartFusion2 device are as follows:

- Density: 64 Mb
- Voltage: 2.7 V to 3.6 V
- Frequency: 104 MHz
- SPI mode support: Modes 0 and 3
- SmartFusion2 MSS: SPI0 interfaced to SPI flash

For more information, see the Board Level Schematics document (provided separately).

4.4 SERDES0 Interface

The SERDES0 interface has four lanes, connected as follows:

1. Lane 0 is directly routed to the PCIe connector.
 - TX pad > trace > AC coupling > trace > via (to bottom layer) > trace > PCIe connector pad
 - RX pad > trace > PCIe connector pad
2. Lane 1 is used for loopback testing. This path is routed between the TX and RX pads with a 6-inch trace and two vias.
 - TX pad > via (to bottom layer) > trace > AC coupling > trace > via (to top layer) > RX pad
3. Lane 2 is routed to SMA connectors.
 - TX pad > trace > AC coupling > trace > SMA connector pad
 - RX pad > trace > via (to bottom layer) > trace > via (to top layer) > SMA connector pad
4. Lane 3 is routed to Marvell PHY 88E1340S.
 - TX pad > trace > AC coupling > trace > via > trace routed in sixth layer > via (to top layer) > Marvel PHY pin
 - RX pad > via > trace routed in sixth layer > via (to top layer) > trace > AC coupling > trace > Marvel PHY pin

SERDES0 reference clock 0 is routed directly from the PCIe connector to the SmartFusion2 device.

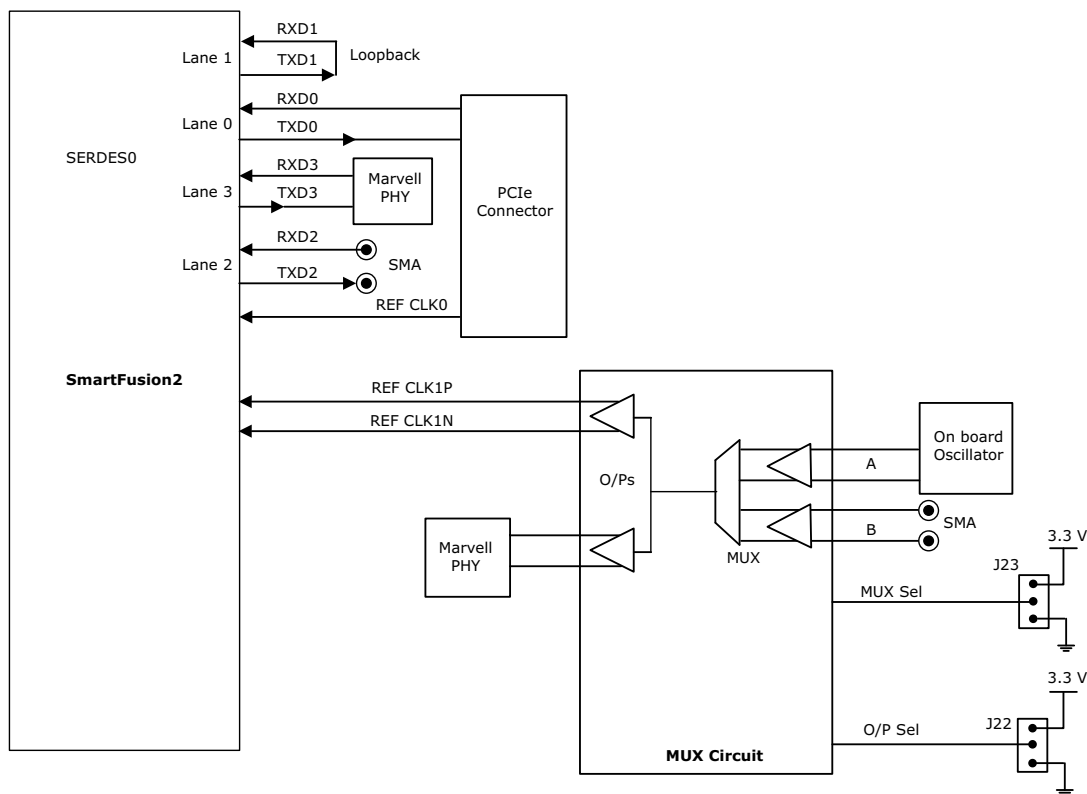

SERDES0 reference clock 1 is routed from the on-board 125 MHz clock oscillator, and optionally routed from SMA connectors through an LVDS MUX or buffer chip.

The expected SerDes reference clock specifications are as follows:

- Voltage level: 3.3 (± 0.3) V
- Differential LVDS
 - Symmetry: 50% ($\pm 10\%$)
 - Rise/fall time: Maximum 1 ns @ 20% to 80% of supply (3.3 V)
 - Output Voltage Levels: 0 = 0.90 minimum, 1.10 typical; 1 = 1.43 typical, 1.60 maximum
 - Differential output voltage: 247 mV minimum, 454 mV maximum

The following figure shows the SERDES0 interface of the SmartFusion2 Security Evaluation Board.

Figure 8 • SERDES0 Interface

For information about the **J22** and **J23** jumpers, see [Table 3](#), page 6.

Notes:

- SERDES0 TXD pairs are capacitively coupled to the SmartFusion2 device. Serial AC-coupling capacitors are used to provide common-mode voltage independence.
- AC-coupling capacitors are not provided for SERDES0 RXD signals. The mating board must have the AC-coupling capacitors.

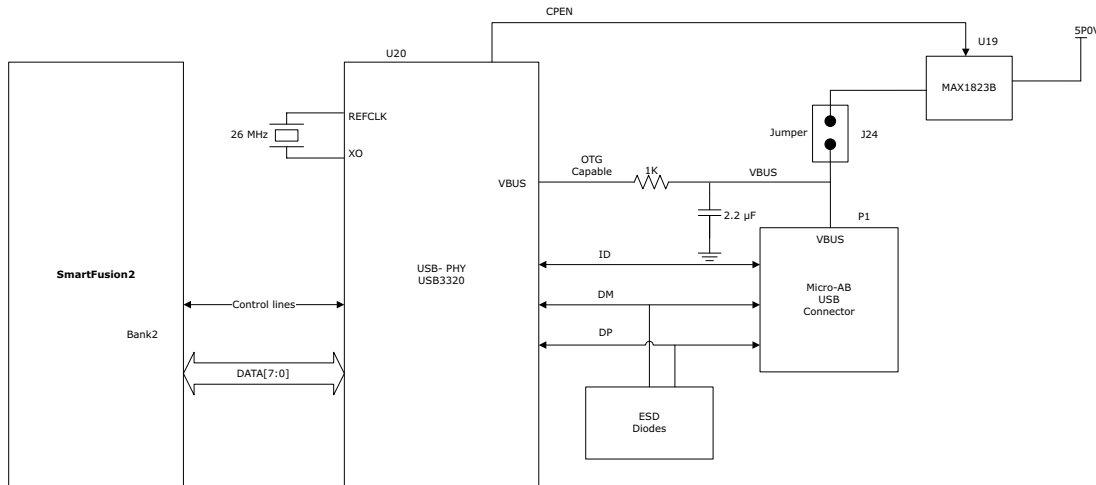

For more information, see the Board Level Schematics document (provided separately).

4.5 USB Interface

The following figure shows the USB interface of the SmartFusion2 Security Evaluation Board. The SMSC USB3320 shown in the figure is a high-speed USB 2.0 ULPI transceiver that supports the optional OTG protocol.

The following figure shows the USB interface of the SmartFusion2 Security Evaluation Board.

Figure 9 • USB Interface

For more information, see the Board Level Schematics document (provided separately).

4.6 Marvell PHY (88E1340S)

The SmartFusion2 Security Evaluation Kit uses Marvell Alaska physical layer (PHY) device 88E1340S for Ethernet communications at 10/100/1000 Mbps. Device 88E1340S has four independent gigabit Ethernet transceivers; however, the board uses only one of the transceivers. Each transceiver performs all the PHY functions for 10BASE-T, 100BASE-TX, and 1000BASE-T full-duplex or half-duplex Ethernet on a CAT5 twisted-pair cable. The PHY device is connected to a user-provided Ethernet cable through an RJ45 connector with built-in magnetics.

Device 88E1340S supports Quad SGMII for direct connection to a SmartFusion2 chip. It is configured through the CONFIG [3:0] and CLK_SEL [1:0] registers.

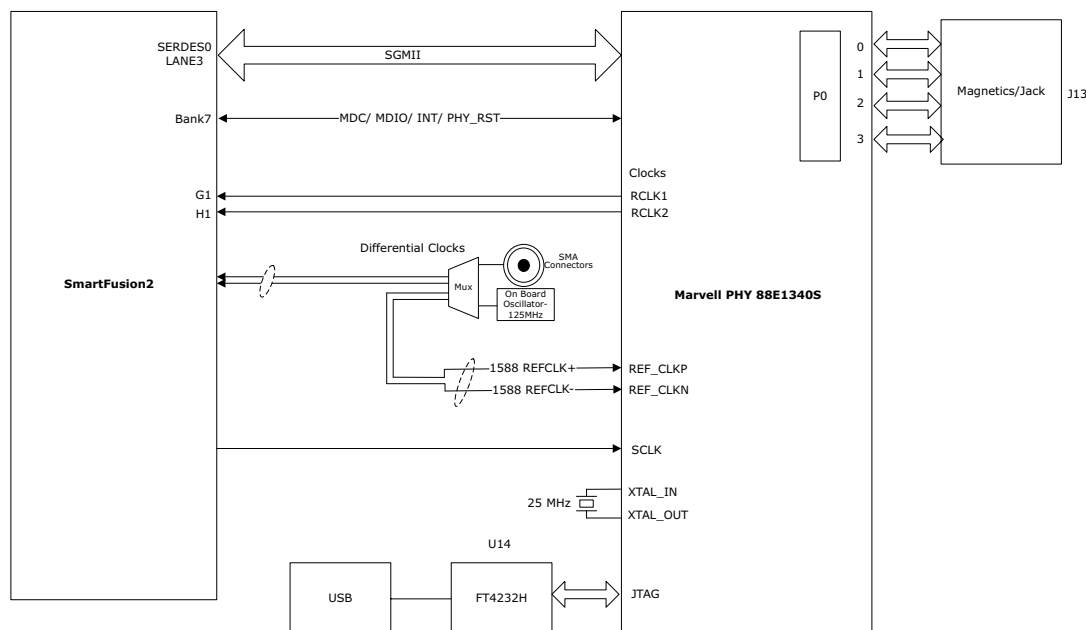

The CLK_SEL [1:0] register is used to select the reference clock input option. On the board, the status of the CLK_SEL0 register is *high* and the status of CLK_SEL1 is *low*. REF_CLK is the 125 MHz reference differential clock input. It consists of LVDS differential inputs with a 100 Ω differential internal termination resistor.

Key features of Marvell PHY 88E1340S are as follows:

- RCLK: Gigabit recovered clock
- SCLK: 25 MHz synchronous input reference clock
- Expected reference clock (REF_CLK) specifications:
 - Voltage level: 3.3 (± 0.3) V
 - Differential LVDS
 - Symmetry: 50% ($\pm 10\%$)
 - Rise/fall time: Maximum 1 ns @ 20% to 80% of supply (3.3 V)
 - Output voltage levels: 0 = 0.90 minimum, 1.10 typical; 1 = 1.43 typical, 1.60 maximum
 - Differential output voltage: 247 mV minimum, 454 mV maximum

The following figure shows the SmartFusion2 Marvell PHY interface.

Figure 10 • Marvell PHY Interface

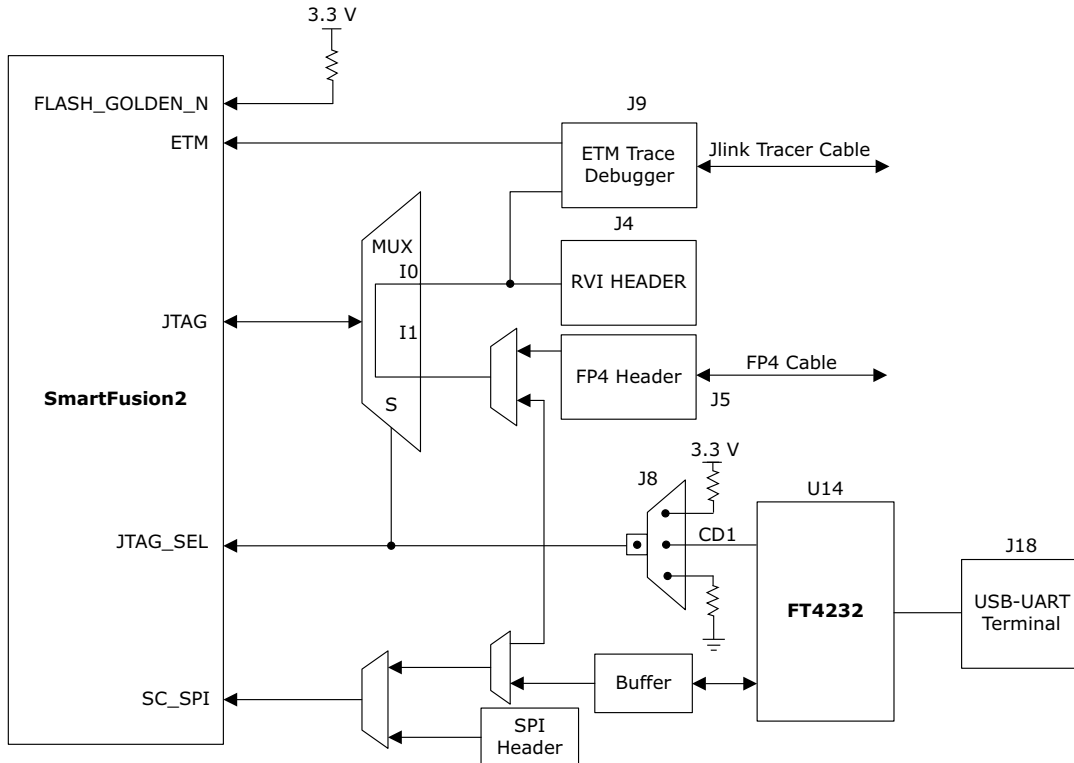

For more information, see the Board Level Schematics document (provided separately).

4.7 Programming

The SmartFusion2 device can be programmed through the SPI slave interface or the JTAG interface. The following figure shows various ways of programming the device.

See [Appendix: FPGA Programming Using FlashPro4](#), page 67 for detailed information about how to program the device using the JTAG interface.

Figure 11 • SmartFusion2 Programming Interface

JTAG_SEL: JTAG_SEL is used to switch between the FlashPro4 header (high) and the RVI header or ETM header (low). For more information about the J8 jumper, see [Table 3](#), page 6.

RVI header: A 10 × 2 RVI header is provided on the board for debugging. This header allows plugging in the Keil ULINK debugger or IAR J-Link debugger.

FlashPro4 programming header: The SmartFusion2 device in the evaluation kit can be programmed using the on-board SPI slave (FlashPro5) or the external FlashPro4 programmer. FlashPro4 is also used for debugging the software using SoftConsole.

For more information, see the Board Level Schematics document (provided separately) and the [IGLOO2 and SmartFusion2 Programming User Guide](#).

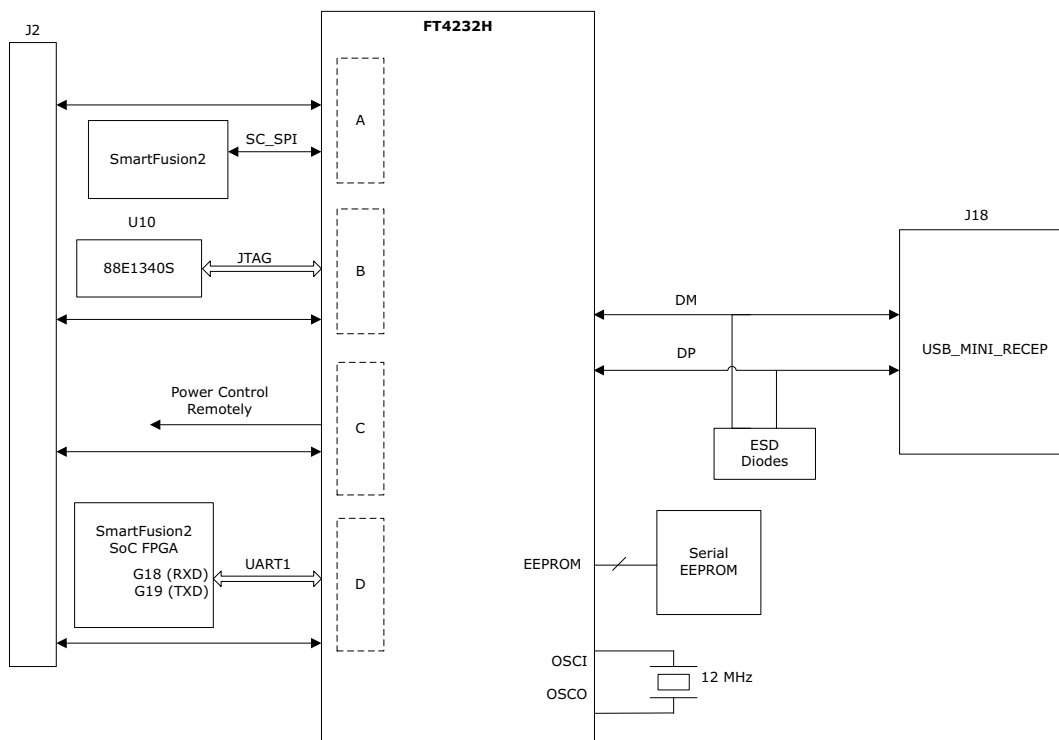

4.8 FTDI Interface

Key features of the FT4232H chip are as follows:

- USB 2.0 high-speed (480 Mbps) to UART/MPSS IC
- Single-chip USB-to-quad serial ports in various configurations
- Entire USB protocol handled on the chip without requiring USB-specific firmware programming
- USB 2.0 high-speed (480 Mbps) and full-speed (12 Mbps) compatibility
- Two multi-protocol synchronous serial engines (MPSS) on channel A and channel B to simplify synchronous serial protocol (USB to JTAG, I2C, SPI, or bit-bang) design
- Fully assisted hardware handshaking and X-On/X-Off software handshaking
- +1.8 V (chip core) and +3.3 V I/O interfacing with +5 V tolerance

The following figure shows the FTDI interface of the SmartFusion2 Security Evaluation Board.

Figure 12 • FTDI Interface

For more information, see the Board Level Schematics document (provided separately).

4.9 I2C Port Header

The following table lists the two I2C ports routed to header H1.

Table 7 • I2C Port Header

Board Signal Name	SmartFusion2 Pin Name	Pin Number	Header H1
I2C0_SCL	MSIO61NB2/I2C_0_SCL/GPIO_31_B/USB_ DATA1_C	G16	10, 14
I2C0_SDA	MSIO61PB2/I2C_0_SDA/GPIO_30_B/USB_ DATA0_C	G17	11, 15
I2C1_SCL	MSIO11NB3/CCC_NE1_CLKI0/I2C_1_SCL/ GPIO_1_A/USB_DATA4_A	R22	2, 6
I2C1_SDA	MSIO11PB3/CCC_NE0_CLKI0/I2C_1_SDA/ GPIO_0_A/USB_DATA3_A	P22	3, 7

For more information, see the Board Level Schematics document (provided separately).

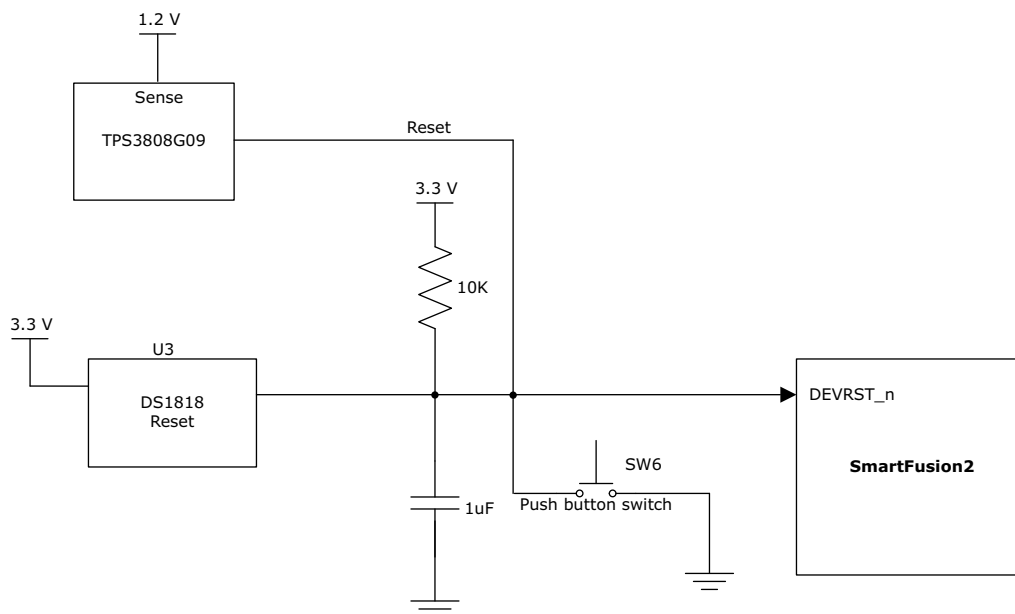

4.10 System Reset

DEVRST_N is an input-only reset pad that allows assertion of a full reset to the chip at any time. The DEVRST_N signal (active-low) is asserted in the following cases:

- When the **SW6** push-button switch is pressed
- When the 3.3 V or 1.2 V supplies fall below the threshold level

The following figure shows the system reset interface of the SmartFusion2 Security Evaluation Board.

Figure 13 • System Reset Interface

For more information, see the Board Level Schematics document (provided separately).

4.11 Clock Sources

This section provides information about the clock sources available in the SmartFusion2 Security Evaluation Kit.

4.11.1 50 MHz Oscillator

A 50 MHz clock oscillator with an accuracy of +/-50 ppm is available on the board. This clock oscillator is connected to the FPGA fabric to provide a system reference clock.

An on-chip SmartFusion2 PLL can be configured to generate a wide range of high-precision clock frequencies.

The following table provides package and pin details of the 50 MHz oscillator.

Table 8 • 50 MHz Clock

SmartFusion2 Security Evaluation Kit Pin Name	SmartFusion2 Package Number	SmartFusion2 Device Pin Name
50MHZ_SECLK_WST_K1	K1	MSIOD178PB7/CCC_SW0_CLKI0

The following figure shows the 50 MHz clock oscillator interface.

Figure 14 • 50 MHz Clock Oscillator Interface

For more information, see the Board Level Schematics document (provided separately).

4.11.2 Other Clock Sources

The following additional clock sources are used in the SmartFusion2 Security Evaluation Kit:

- A 125 MHz clock oscillator for the SerDes0 interface. For more information, see [SERDES0 Interface](#), page 12.
- 32.768 KHz crystal oscillators for the main and auxiliary oscillators of the SmartFusion2 device.

4.12 User Interface

The SmartFusion2 Security Evaluation Board UI has user LEDs as well as push-button switches.

4.12.1 User LEDs

The board has eight active-low LEDs that are connected to the SmartFusion2 device. The following table lists the on-board user LEDs.

Table 9 • LEDs

SmartFusion2 Security Evaluation Board Pin	SmartFusion2 Package Pin Number	SmartFusion2 Device Pin Name
LED0 – Yellow	E1	MSIO143PB8
LED1 – Yellow	F4	MSIO145NB8
LED2 – Green	F3	MSIO145PB8
LED3 – Green	G7	MSIO146NB8
LED4 – Red	H7	MSIO146PB8
LED5 – Red	J6	MSIO148NB8
LED6 – Blue	H6	MSIO148PB8
LED7 – Blue	H5	MSIO150NB8

The following figure shows the LED interface of the SmartFusion2 Security Evaluation Board.

Figure 15 • LED Interface

For more information, see the Board Level Schematics document (provided separately).

4.12.2 Push-Button Switches

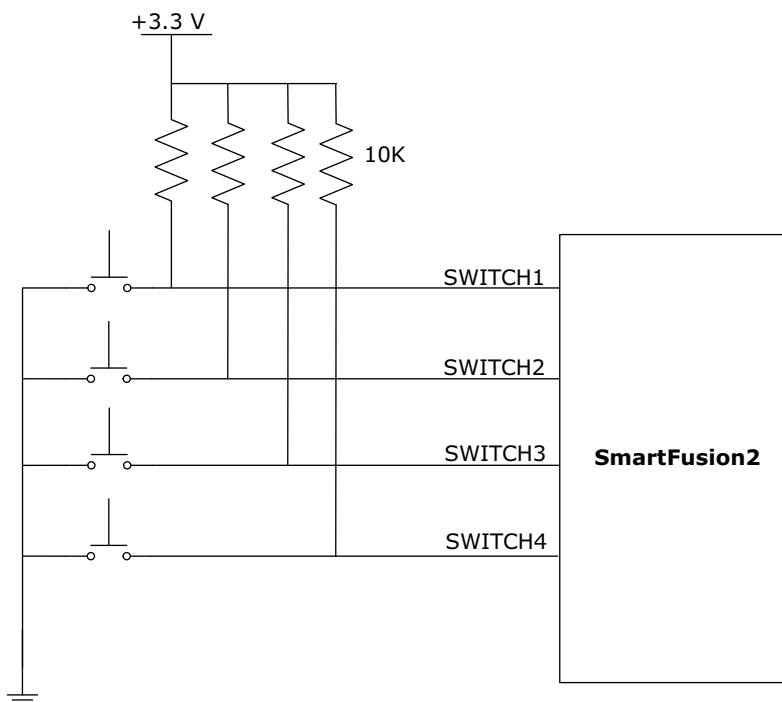

The SmartFusion2 Security Evaluation Kit comes with five push-button tactile switches that are connected to the SmartFusion2 device. The following table lists the on-board push-button switches.

Table 10 • Push-Button Switches

SmartFusion2 Security Evaluation Board Pin	SmartFusion2 Package Pin Number	SmartFusion2 Device Pin Name
SWITCH1	L20	MSIO17NB3/SPI_1_SS0/GPIO_13_A
SWITCH2	K16	MSIO23NB3/SPI_1_SS1/GPIO_14_A
SWITCH3	K18	MSIO24PB3/SPI_1_SS2/GPIO_15_A
SWITCH4	J18	MSIO24NB3/SPI_1_SS3/GPIO_16_A
SW6	R15	DEVRST_N

The following figure shows the switches interface of the SmartFusion2 Security Evaluation Board.

Figure 16 • Switches Interface

For more information, see the Board Level Schematics document (provided separately).

4.12.3 Slide Switches (DPDT)

The **SW7** slide switch powers the device ON or OFF from +12 V external DC jack.

4.12.4 DIP Switches (SPST)

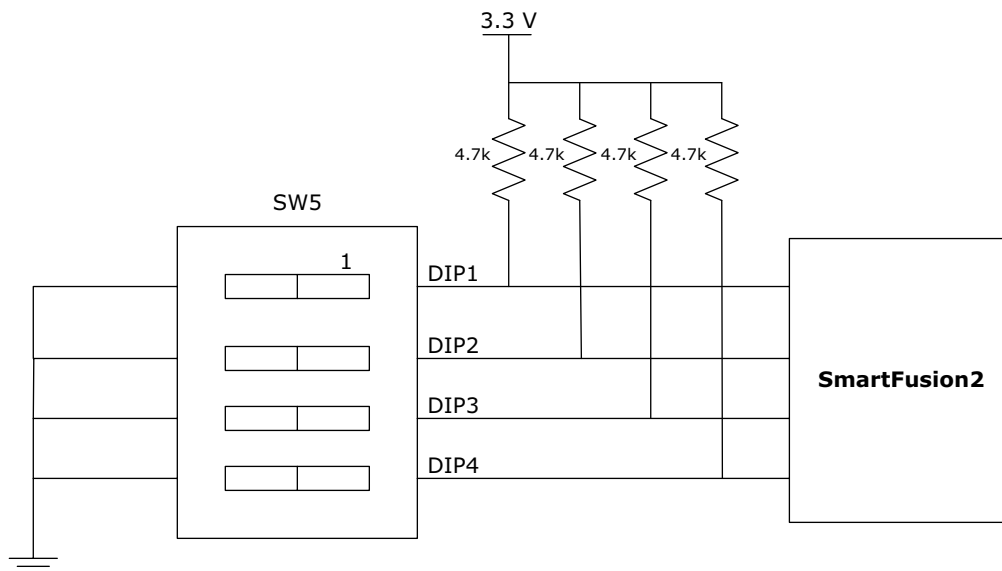

The **SW5** DIP switch has four connections to the SmartFusion2 device. The following table lists the on-board DIP switches.

Table 11 • DIP Switches

SmartFusion2 Security Evaluation Board Pin	SmartFusion2 Package Pin Number	SmartFusion2 Device Pin Name
DIP1	L19	MSIO18PB3/SPI_1_SS4/GPIO_17_A
DIP2	L18	MSIO18NB3/SPI_1_SS5/GPIO_18_A
DIP3	K21	MSIO19PB3/SPI_1_SS6/GPIO_23_A
DIP4	K20	MSIO19NB3/SPI_1_SS7/GPIO_24_A

The following figure shows the SPST interface of the SmartFusion2 Security Evaluation Board.

Figure 17 • SPST Interface

For more information, see the Board Level Schematics document (provided separately).

4.13 GPIO Header Pinout

Bank 4, bank 7, and bank 1 signals are routed to the GPIO header for user applications. The following table provides GPIO header pinout details.

Table 12 • GPIO Header Pinout

GPIO Header-J1			SmartFusion2 - U1			GPIO Header-J1			SmartFusion2 - U1		
Pin Number	Package Number	Pin Name				Pin Number	Package Number	Pin Name

6 Board Components Placement

The following figure shows the placement of various components on the SmartFusion2 Security Evaluation Kit silkscreen.

Figure 18 • Silkscreen Top View

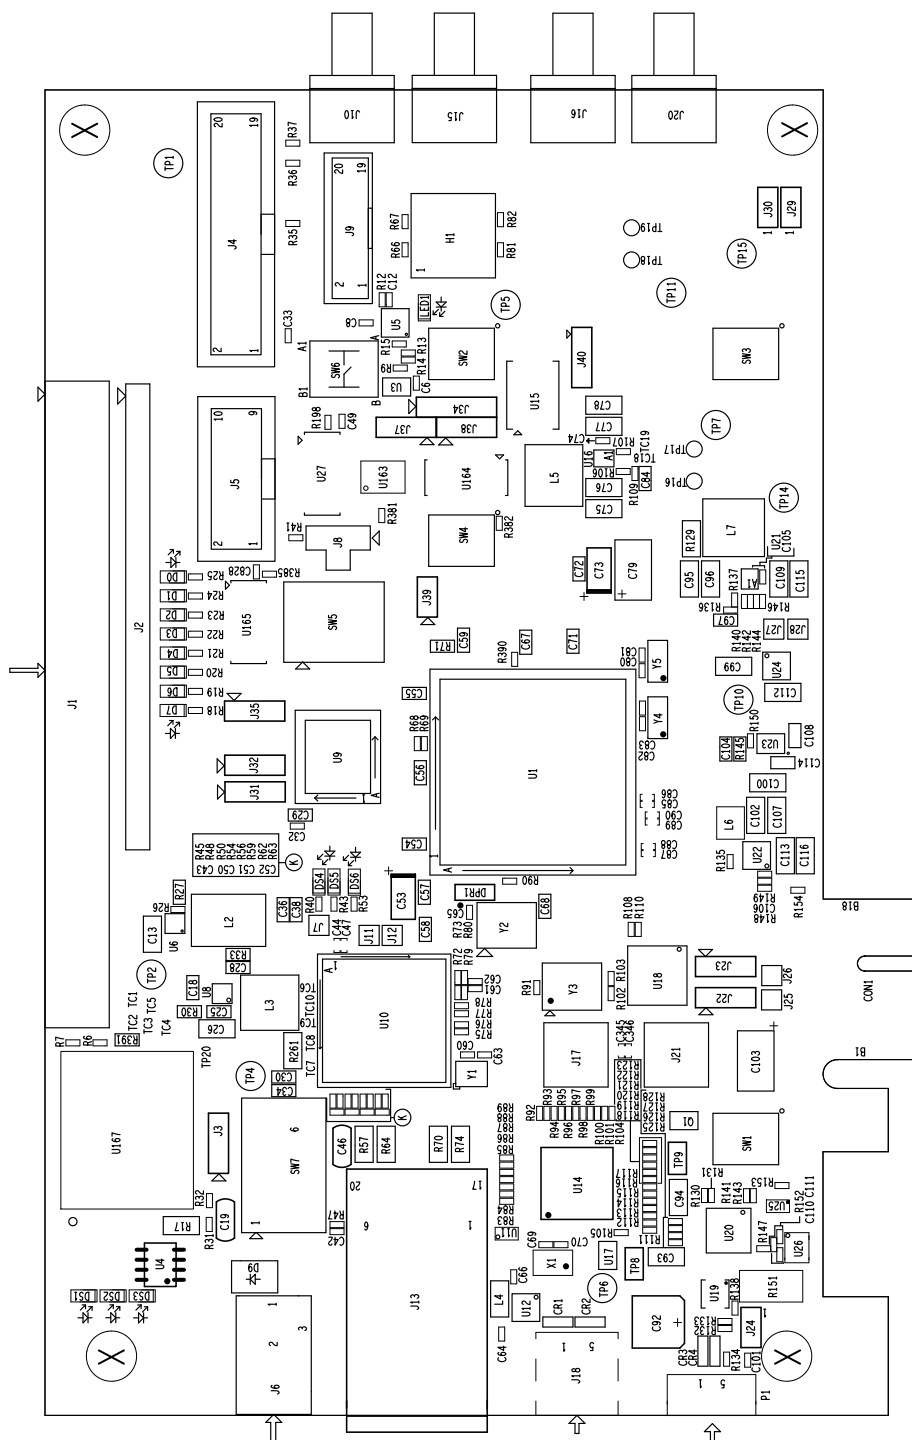

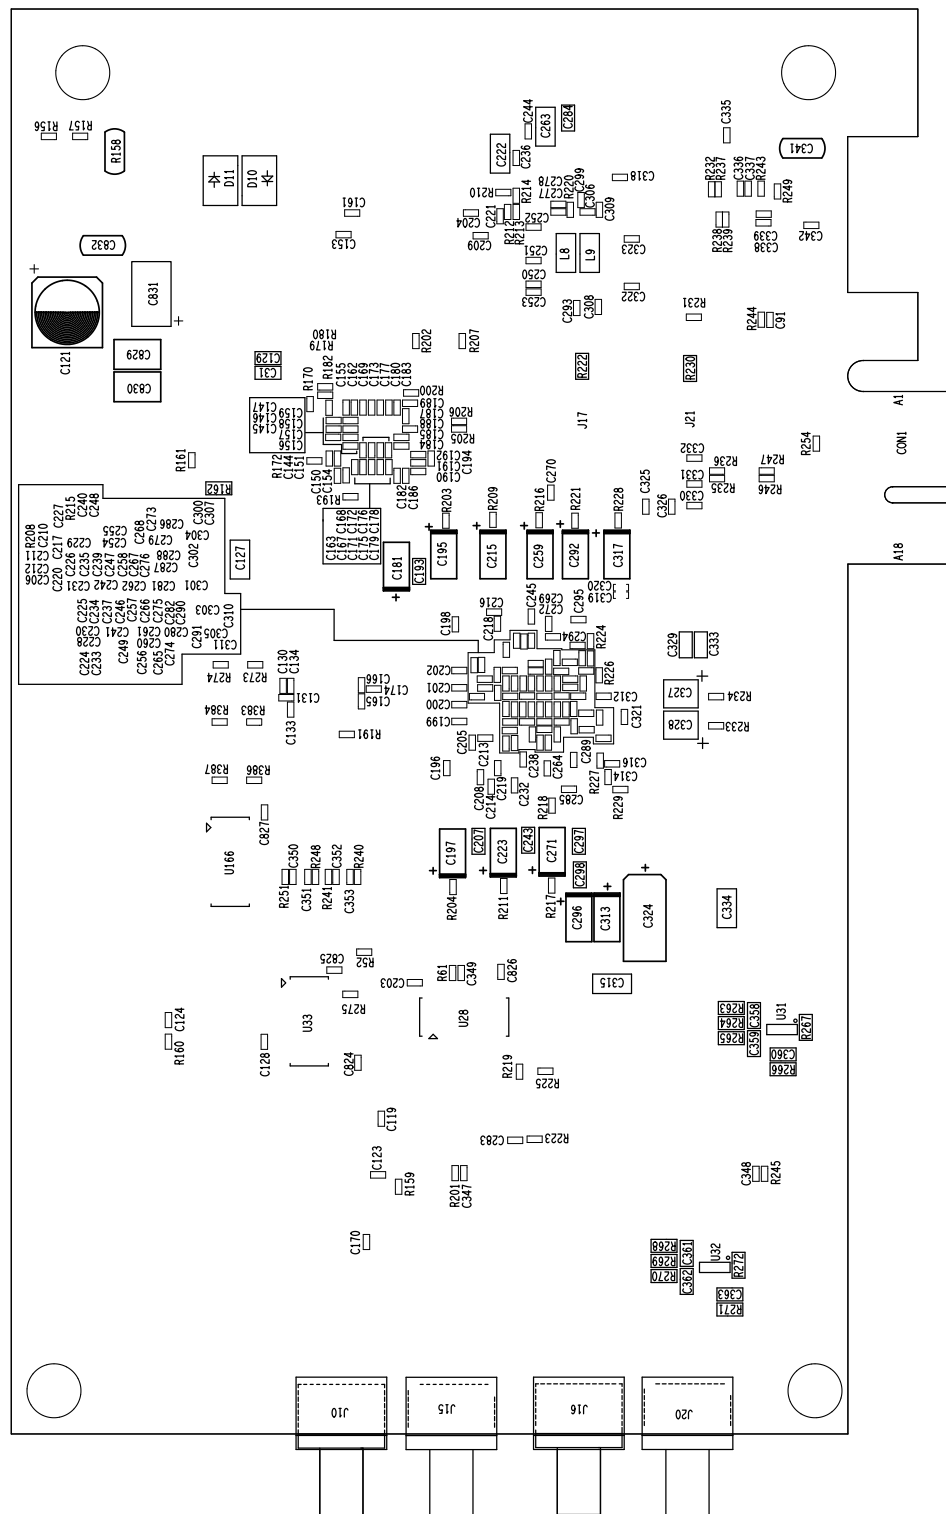

Figure 19 • Silkscreen Bottom View

7 Demo Design

The SmartFusion2 M2S090TS-EVAL-KIT comes with a preloaded PCIe control plane design to demonstrate the PCIe interface of the SmartFusion2 device. The following table lists the requirements for running the PCIe demo design.

Table 14 • PCIe Demo Design Requirements

Design Requirements	Version
Host PC or laptop with a PCIe 2.0 Gen 1- or Gen 2-compliant slot	64-bit Windows 7 OS or 64-bit Red Hat Linux OS (kernel version 2.6.18-308)
Express card slot and PCIe card adapter for laptop only (not provided with the kit contents)	–
PCIe edge card ribbon cable (not included in the kit)	–
Host PC drivers (provided with the design files)	–
GUI executable (provided with the design files)	–

The design files for this demo can be downloaded from the Microsemi website:

http://soc.microsemi.com/download/rsc/?f=sf2_pcie_control_plane_demo_advanced_and_evaluation_kit_liberov11p4_dg_df

For information about how to run the demo design, see [Appendix: Running the PCIe Demo Design on Windows](#), page 56.

8 Manufacturing Test

The M2S090TS-EVAL-KIT contains a manufacturing test program that can be run to verify the functionality of the board. The test program contains a list of options that can be run as diagnostics. After the HyperTerminal is set up and the board is powered up, various tests that can be performed on the board are displayed (see Figure 30, page 48). One or more tests can then be selected from the list of available tests.

Before testing the SmartFusion2 Security Evaluation Board:

- Download the `M2S090_EVAL_KIT_MTD_SP1.prjx` file from http://soc.microsemi.com/download/rsc/?f=M2S090TS_EVAL_KIT_DF.
- Download and install the FTD drivers from <http://www.ftdichip.com/Drivers/D2XX.htm>.

8.1 Programming M2S090TS-EVAL-KIT

This section provides information about programming the M2S090TS-EVAL-KIT for the manufacturing test.

8.1.1 Installing Libero v11.5 or Later

Before starting the manufacturing test, make sure the Libero SoC software (v11.5 or later) and other required tools are installed (see Software Settings, page 6). After Libero v11.5 or later is installed, connect J18 to the host PC using a mini USB to Type A USB cable.

8.1.2 Validating Power Supply

To test and validate the power supply to the board:

1. Connect the following jumpers on the SmartFusion2 Security Evaluation Board:
 - Short the **J3** jumper to position 1-2
 - Short the **J8** jumper to position 1-2
 - Short the **J22** and **J23** jumpers to position 1-2
 - Short the **H1** jumper to position 6-10
 - Short the **H1** jumper to position 7-11
 - Short the **J24** jumper to position 1-2
 - Short the **J31** jumper to position 1-2
 - Short the **J35** jumper to position 2-3

Note: Before making the jumper connections, switch OFF the **SW7** power supply switch.

2. Connect the 12 V/5 A power supply brick to the J6 jumper.
3. Switch ON the power supply switch, **SW7**.
When the board is successfully set up, the DS1, DS2, and DS3 LEDs start glowing.

8.1.3 Programming the FPGA Using Embedded FlashPro5

The M2S090TS-EVAL-KIT has an embedded FlashPro5 programmer; therefore, an external programmer is not required to program the SmartFusion2 device. The device can be programmed using the embedded FlashPro5, provided the FlashPro software is installed on the host PC.

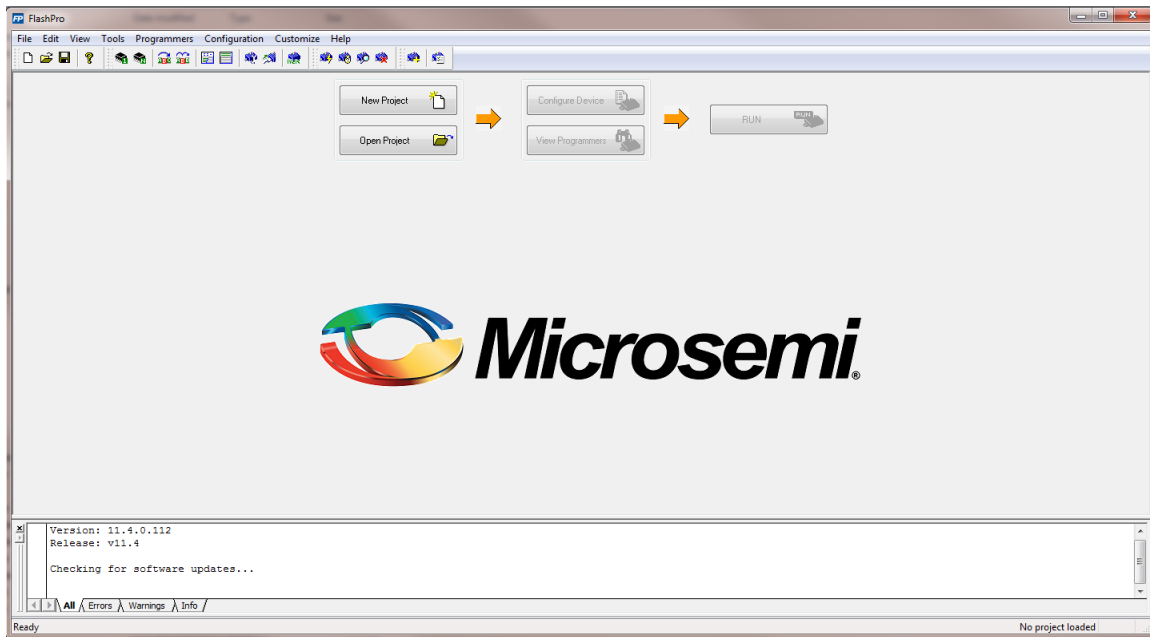

Note: The board can also be programmed using FlashPro4. To program the board using FlashPro4, connect the FlashPro4 header to the **J5** jumper, and change the position of the **J35** jumper to pin 1-2.

To program the device using the embedded FlashPro5:

1. Connect one end of a mini USB to Type A USB cable to the **J18** jumper and the other end to the USB port of the host PC.

2. Launch the FlashPro software.

Figure 20 • FlashPro Window

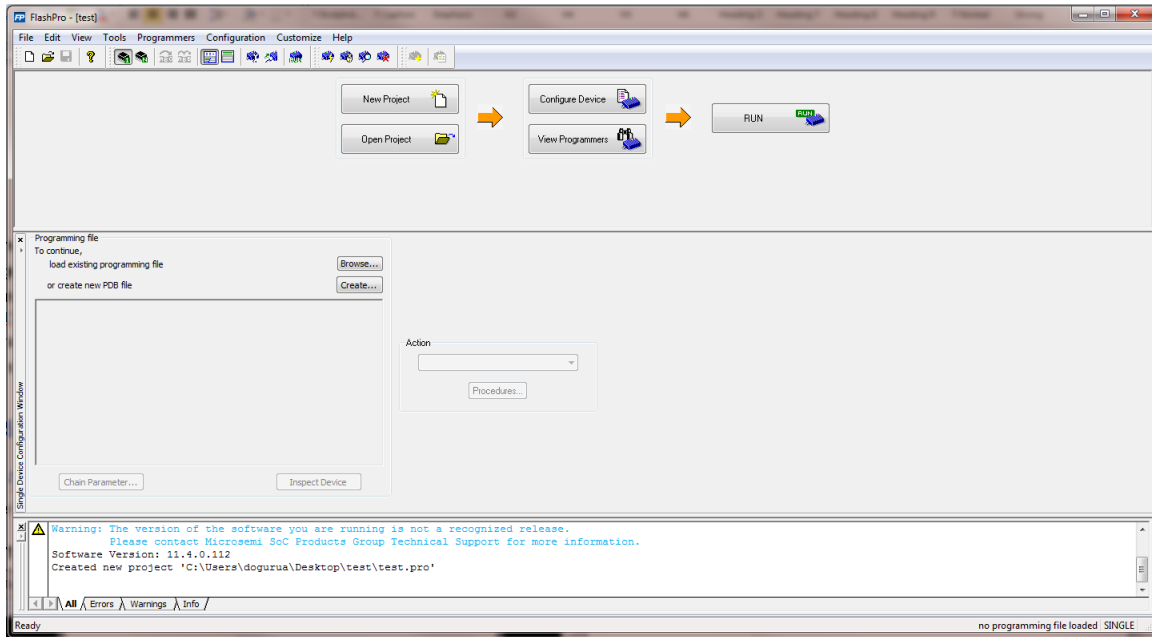

3. Click **New Project** to create a new project.
4. In the **New Project** window, do the following, and click **OK**:
 - Enter a project name.
 - Select **Single device** as the programming mode.

Figure 21 • New Project Window

- Click **Configure Device**.

Figure 22 • Configuring the Device

- Click **Browse**, and select the `SEC_KIT_MTD_top.stp` file from the **Load Programming File** window.
- Click **Program** to program the device.
When the device is programmed successfully, a **Run Program PASSED** status is displayed.

8.2 Running the Manufacturing Test

This section describes how to run the manufacturing test for the SmartFusion2 Security Evaluation Board.

8.2.1 Setting Up HyperTerminal

To set HyperTerminal up for the manufacturing test:

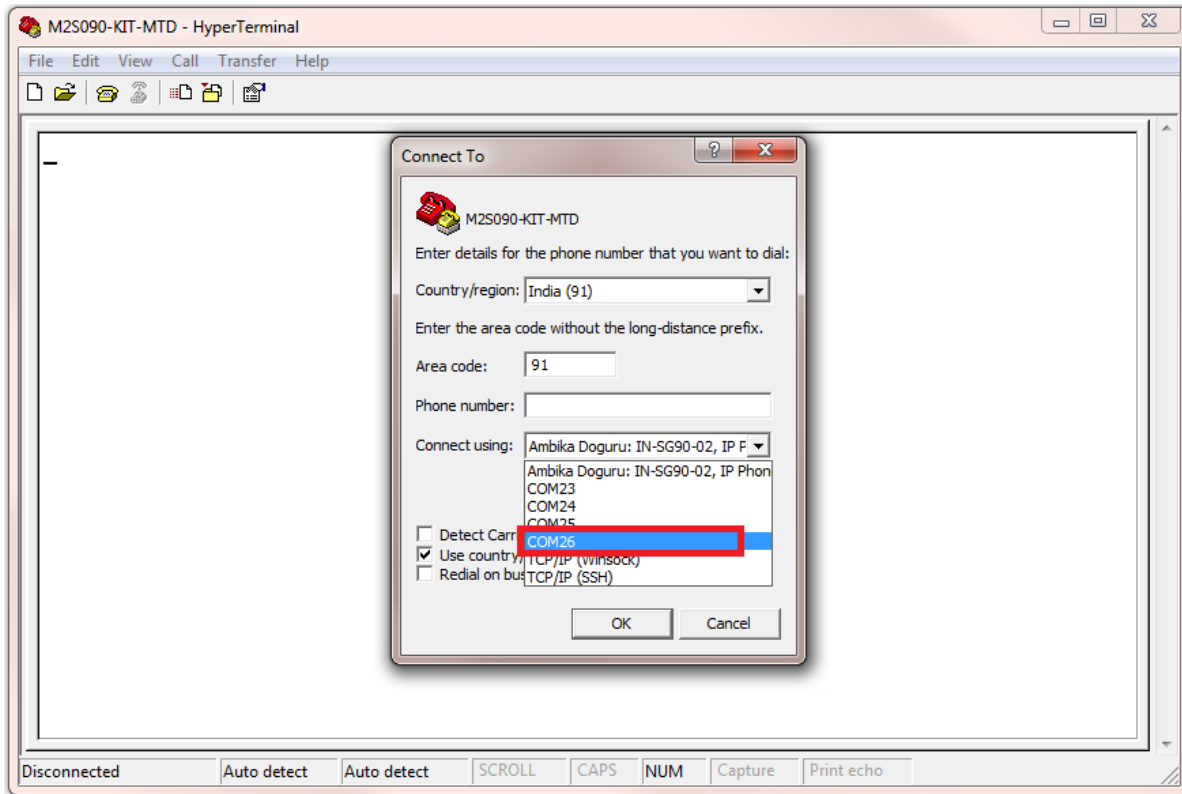

1. Connect **J18** to the host PC using a mini USB to Type A USB cable.
2. Launch **HyperTerminal** from the Start menu.

Figure 23 • Connection Description Window

3. Enter **M2S090-KIT-MTD** as the connection name, and click **OK**.
The **Connect To** dialog-box appears, as shown in the following figure.

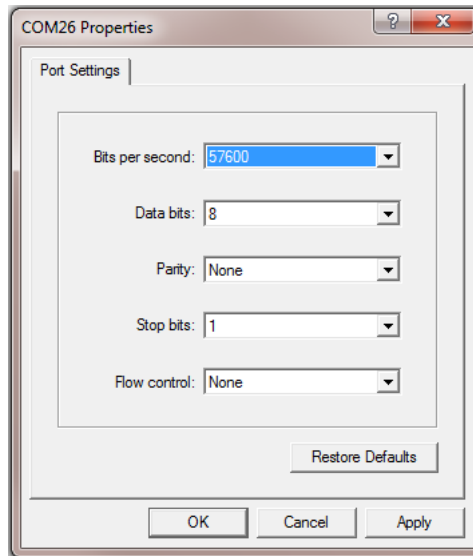

Figure 24 • Connect To Window

4. Select the highest value COM port from the **Connect using** drop-down list, and click **OK**.
- Note:** When using a USB cable for HyperTerminal communication, four COM ports are available in the drop-down list.
5. When only one COM port appears, select the COM port to establish connection with the host PC.

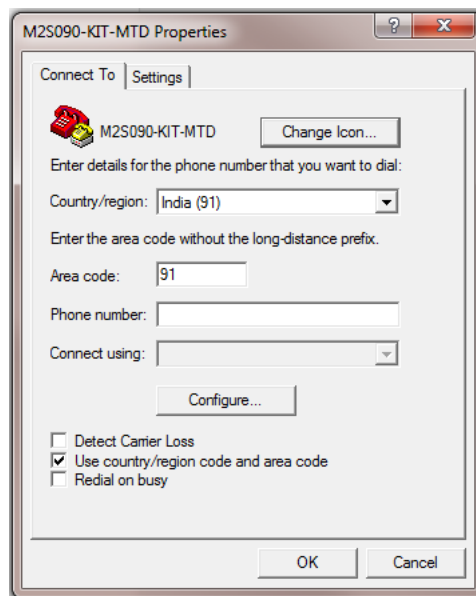

6. In the **Port Settings** window, select the following settings:
 - Bits per second: 57600
 - Data bits: 8
 - Parity: None
 - Stop bits: 1
 - Flow control: None

Figure 25 • Port Settings Window

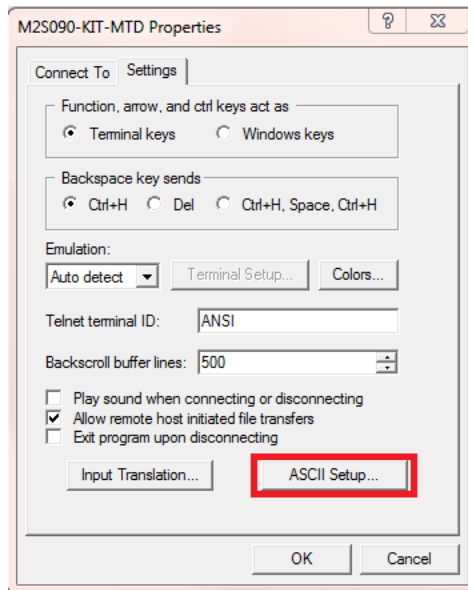

7. Click **Apply**, then click **OK**.
8. Select **Properties** from the **File** menu in the HyperTerminal window.
The **M2S090-KIT-MTD Properties** window appears, as shown in the following figure.

Figure 26 • M2S090-KIT-MTD Properties Window

9. Select the **Settings** tab.

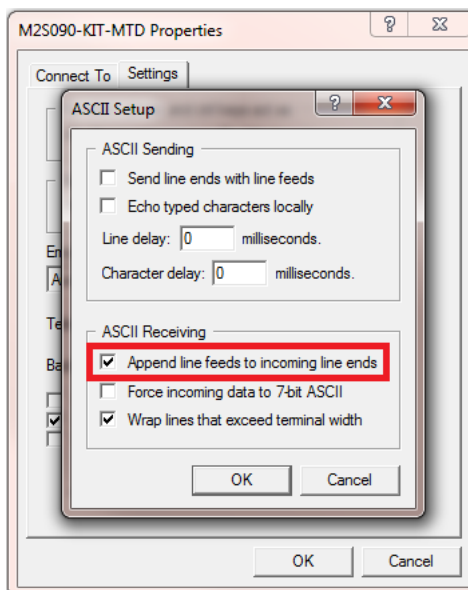

Figure 27 • Settings Tab

10. Keep the default settings, and click **ASCII Setup**.

The **ASCII Setup** dialog-box appears, as shown in the following figure.

Figure 28 • ASCII Setup Window

11. Select the **Append line feeds to incoming line ends** check box, and click **OK**.
12. Click **OK** to save the properties, and close the **M2S090-KIT-MTD Properties** window.

13. Press the **SW6** switch to restart the board with the selected settings.
 The **HyperTerminal** window appears, as shown in the following figure.

Figure 29 • HyperTerminal Window

8.2.2 Setting Up Jumpers

The following table specifies the jumper settings required to perform various tests on the SmartFusion2 Security Evaluation Board.

Table 15 • Jumper Settings for Manufacturing Test

Test	Jumper Settings
HyperTerminal communication test	Connect J18 to the host PC using a mini USB to Type A USB cable).
RTC test	—
I2C test	Short H1 pins 6–10 and 7–11.
LPDDR3 memory test	—
SPI memory test	—
USB device test	Connect Micro B to P1, and connect other end of the cable to the host PC (type A).
SerDes loopback test	Connect J20 to J15, and J16 to J10 using an SMA-to-SMA cable. Loopback cable (5 Gbps data rate).
SGMII test	Connect an Ethernet cable to J13, and connect the other end of the cable to the 1 Gbps Ethernet switch or network.

8.2.3 Running the Test

After the device is programmed and the jumper settings are applied, follow these steps to run the manufacturing test:

1. Press the **SW6** reset switch on the M2S090TS-EVAL-KIT to reset the board and begin the tests. When the setup is completed, all tests are listed in the **HyperTerminal** window, as shown in the following figure.

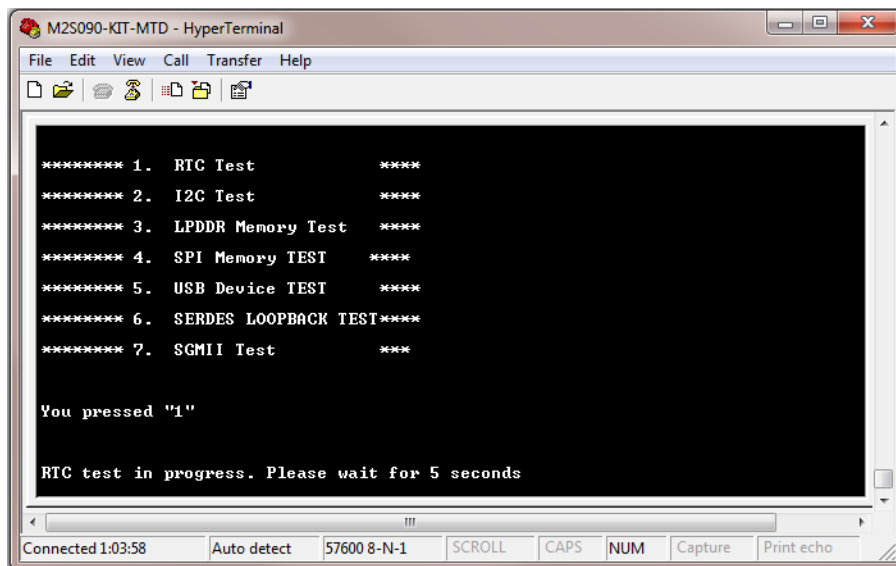

Figure 30 • Test Menu

If the list of tests does not appear, press the **SW6** reset switch again. If the list still does not appear, then check all the jumpers, and the HyperTerminal settings.

2. Press **1** to run the RTC test. Wait for five seconds for the test to be run. The following message appears.

Figure 31 • Running RTC Test

When the test is passed, the following message appears.

Figure 32 • RTC Test Passed

3. Press 2 to run the I2C loopback test.

When the test is passed, the following message appears.

Figure 33 • I2C Test Passed

4. Press **3** to run the LPDDR memory test.
The following message appears.

Figure 34 • LPDDR Memory Test

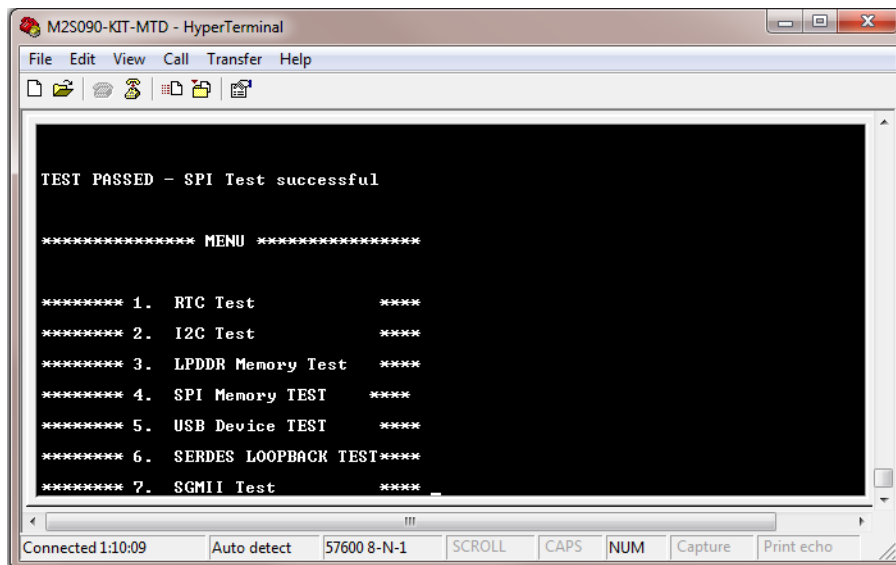

When the test is passed, the following message appears.

Figure 35 • LPDDR Memory Test Passed

5. Press **4** to run the SPI memory test.
When the test is passed, the following message appears.

Figure 36 • SPI Memory Test Passed

Press **6** to run the USB device test. When the test is passed, the following message appears.

Figure 37 • USB Device Test Passed

6. Press and hold the **SW2** switch on the board, and observe the mouse cursor moving to the right side.
7. Press the **SW6** reset switch to go back to the main menu.

8. Press **6** to run the SerDes loopback test shown in the following figure.

Note: Ensure that the loopback cable is connected. See [Setting Up Jumpers](#), page 47.

Figure 38 • SerDes Loopback Test

9 Appendix: Running the PCIe Demo Design on Windows

The SmartFusion2 M2S090TS-EVAL-KIT comes with a preloaded PCIe control plane demo design. See [Appendix: FPGA Programming Using FlashPro4](#), page 67 for information about how to reprogram the board with the PCIe control plane demo.

9.1 Connecting the Board to the Host PC

To connect the board to the host PC, follow these steps:

1. After successful programming, power **OFF** the SmartFusion2 Security Evaluation Board and shut down the host PC.
2. Follow these steps to connect the **CON1-PCIe Edge Connector** to a host PC or a laptop:
 - Connect the **CON1** PCIe edge connector to host PC's PCIe Gen 1 or Gen 2 slot as applicable. If the host PC does not support the Gen 2-compliant slot, the design automatically switches to the Gen 1 slot.
 - Connect the **CON1** PCIe edge connector to the laptop PCIe slot using an express card adapter. For laptops, express card adapters typically support only Gen 1, and designs work on the Gen 1 slot.

CAUTION: The host PC or laptop must be powered OFF while inserting the PCIe edge connector. If the system is not powered OFF, PCIe device detection and selection of the device generation (Gen 1/Gen 2) may not occur properly.

Figure 45 • SmartFusion2 Security Evaluation Kit Setup for Host PC

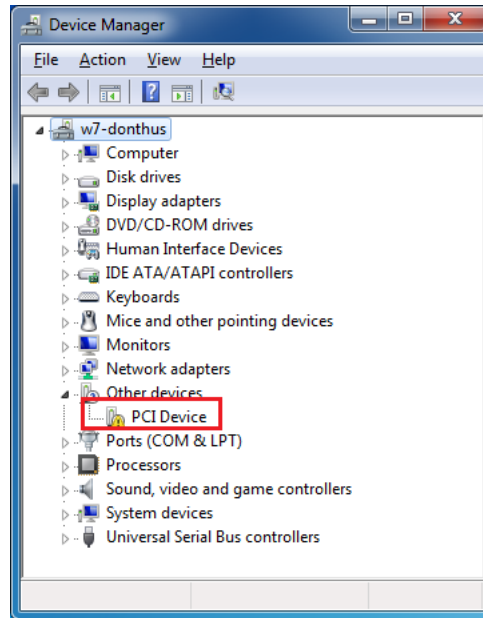

9.2 Running the Demo Design

This section describes how to run the PCIe demo design included in the SmartFusion2 Security Evaluation Kit.

1. Power on the host PC and open the host PC Device Manager for PCIe device, as shown in the following figure.

Figure 46 • Device Manager

Notes:

- If the PCIe device is not detected, power-cycle the SmartFusion2 Security Evaluation board. To do this, right-click **PCI Device** > **Scan for hardware changes** in Device Manager.
 - If the device is still not detected, check if the BIOS version in host PC is the latest, and if PCIe is enabled in the host PC BIOS.
 - If the host PC has any other installed drivers (previous versions of Jungo drivers) for the SmartFusion2 PCIe device, uninstall them.
2. In Device Manager, right-click **DEVICE** and select **Uninstall**, as shown in the following figure.

Figure 47 • Device Uninstall

The **Confirm Device Uninstall** dialog box appears.

3. Select the **Delete the driver software for this device** check box, and click **OK**, as shown in the following figure.

Figure 48 • Confirm Device Uninstall

After uninstalling previous Jungo drivers, make sure that the PCIe device is detected in the Device Manager window, as shown in [Figure 46](#), page 57.

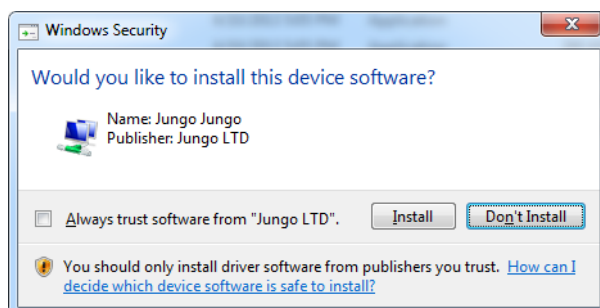

9.2.1 Installing Drivers

The PCIe Demo uses a driver framework provided by Jungo WinDriverPro. To install the latest version of the PCIe drivers for SmartFusion2 Security Evaluation Board on the host PC, follow these steps:

Note: Installation of drivers requires administrative rights on the host PC.

1. Extract the `PCIe_Demo.rar` file to the **C** drive. The file is located in the design files: **M2S150_M2S25_PcIe_Control_Plane_DF\Windows_64bit\Drivers**
2. Run the batch file `C:\PCIe_Demo\DriverInstall\Jungo_KP_install.bat`. In the **Windows Security** dialog box, click **Install**, as shown in the following figure.

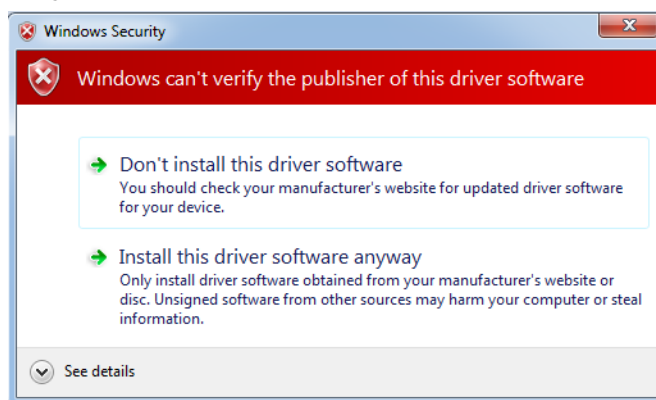

Figure 49 • Jungo Driver Installation

Note: If the installation does not begin automatically, right-click **Command Prompt** from the Start menu, select **Run as administrator**, and run the batch file from the command prompt.

3. Click **Install this driver software anyway**, as shown in the following figure.

Figure 50 • Windows Security

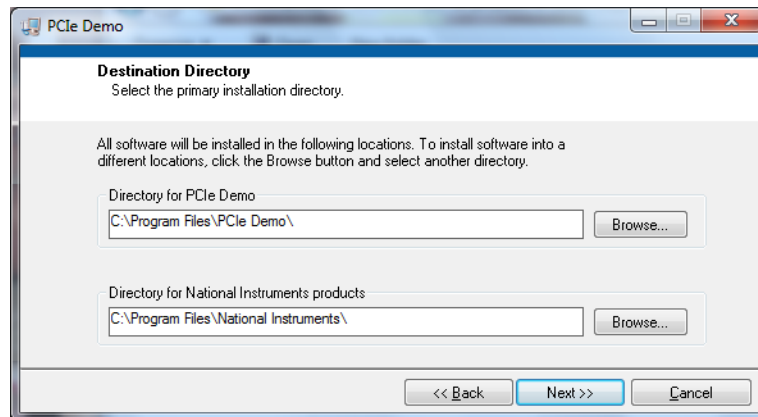

9.2.2 Installing PCIe Demo GUI

The SmartFusion2 PCIe demo GUI is a simple GUI that runs on the host PC and enables communication with the SmartFusion2 PCIe EP device. The GUI provides PCIe link status, driver information, and demo controls. It invokes the PCIe driver installed on the host PC and issues user-selected commands to the driver.

To install the GUI:

1. Extract the `PCIe_Demo_GUI_Installer.rar` from the design files located at **M2S150_M2S25_PCl_e_Control_Plane_DF\Windows_64bit\GUI**.
2. Double-click the `setup.exe` file in the provided GUI installation (**PCIe_Demo_GUI_Installer\setup.exe**).
3. Retain the default directory locations shown in the following figure, and click **Next**.

Figure 51 • GUI Installation

4. Click **Finish** to complete the installation.
The following window appears upon successful installation.

Figure 52 • Successful GUI Installation

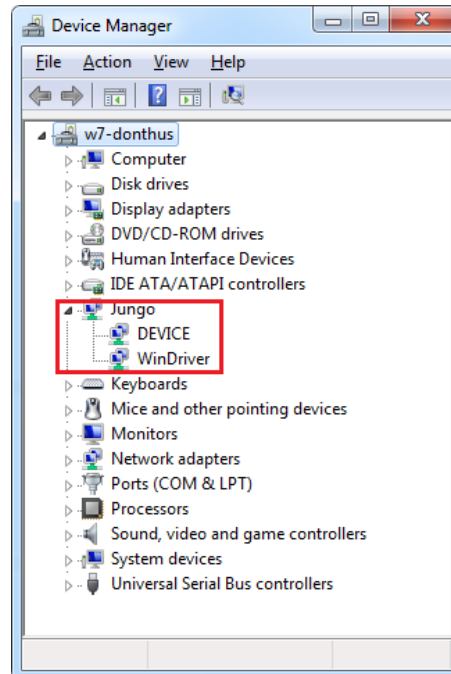

5. Restart the host PC.

9.2.3 Running the PCIe GUI

To launch the PCIe GUI and use the demo controls:

1. Check the host PC's Device Manager for the drivers. If the device is not detected, power-cycle the SmartFusion2 Evaluation Board.
2. Right-click **DEVICE** > **Scan for hardware changes** in Device Manager. Make sure that the board is switched ON.

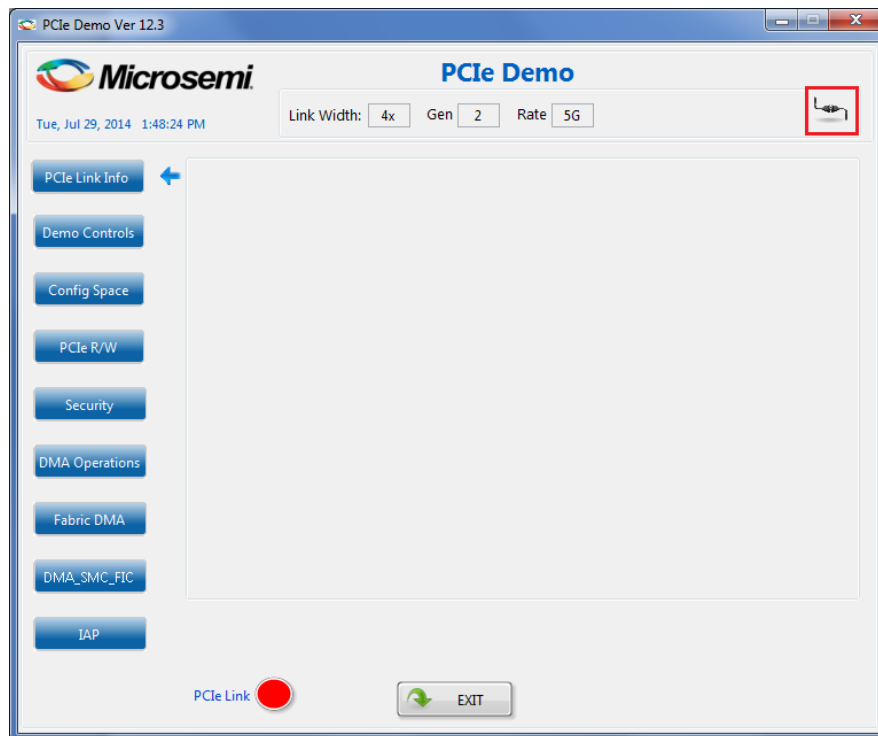

Figure 53 • PCIe Device Detection in Device Manager

Note: If a warning symbol is displayed on the **DEVICE** or **WinDriver** icons in the Device Manager, uninstall and reinstall the drivers (see [Installing Drivers](#), page 58).

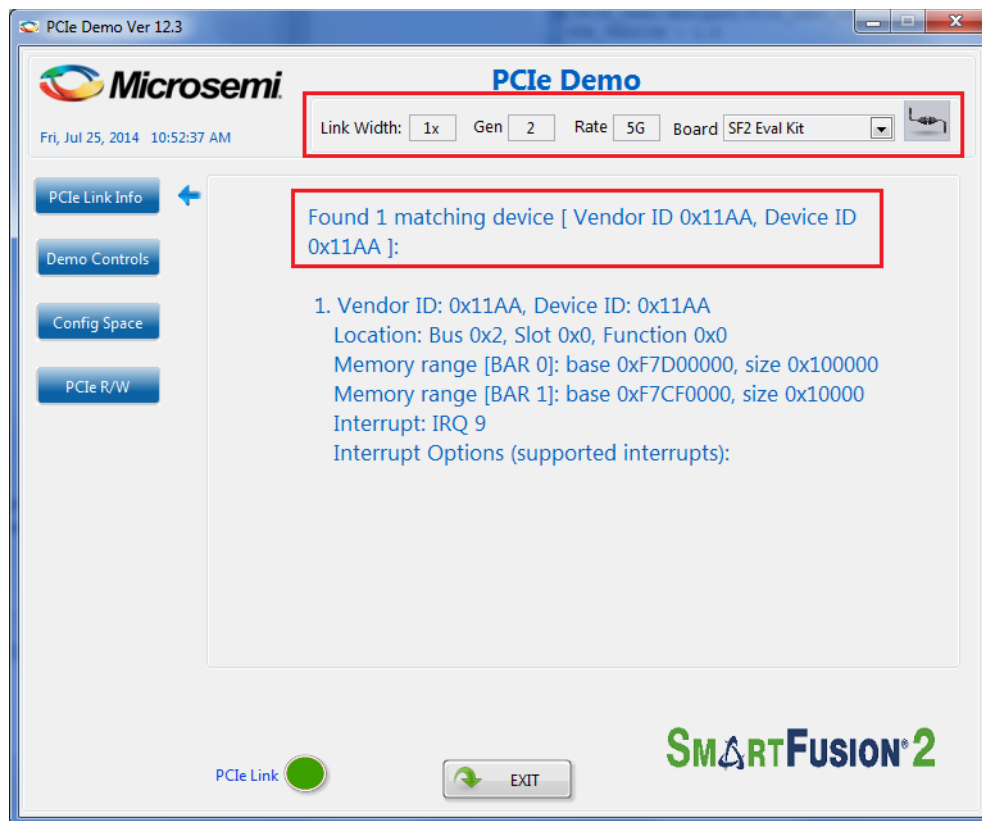

3. Open the PCIe Demo GUI (shown in the following figure) from **ALL Programs > PCIeDemo > PCIe Demo GUI**.

Figure 54 • PCIe Demo GUI

- Click the **Connect** icon (highlighted in the above figure) at the top-right corner of the GUI. The link width, device generation (Gen 1/Gen 2), data rate, and kit type are displayed on the GUI, as shown in the following figure.

Figure 55 • Version Information

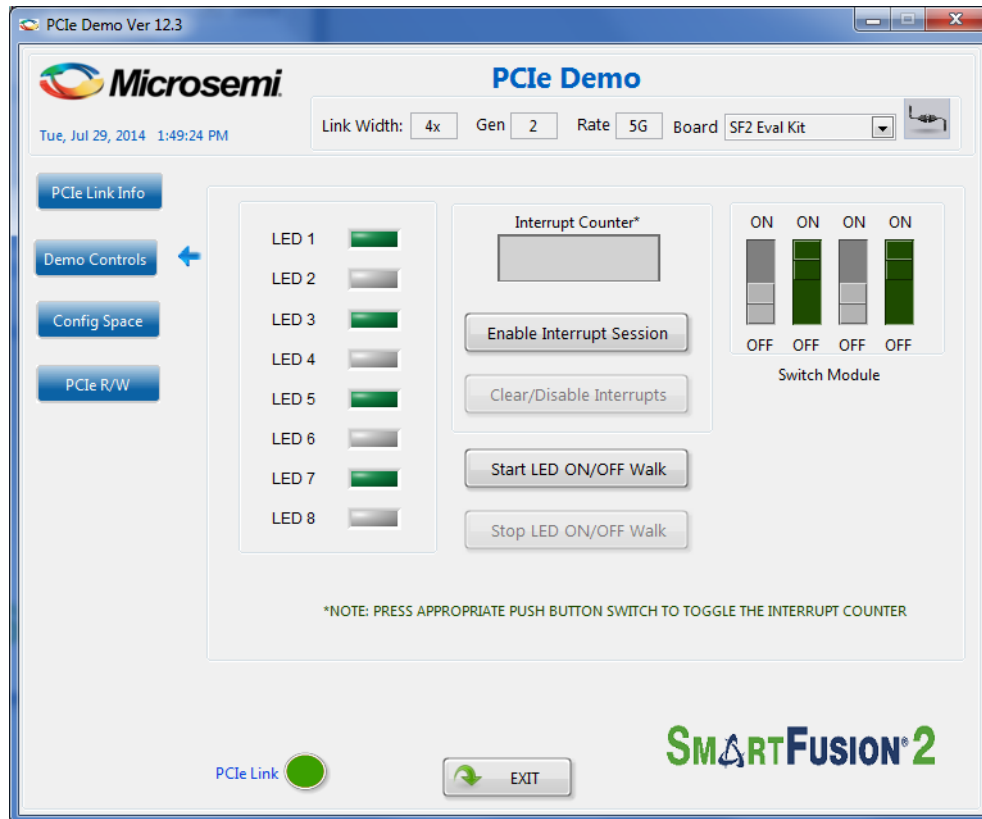

Notes:

- The SmartFusion2 Security Evaluation Kit provides x1 PCIe lane width for board configuration.
- If the host PC does not support the Gen 2 slot, the design automatically changes to the Gen 1 slot.

- Click **Demo Controls** to display the LED options and DIP switch status, as shown in the following figure.

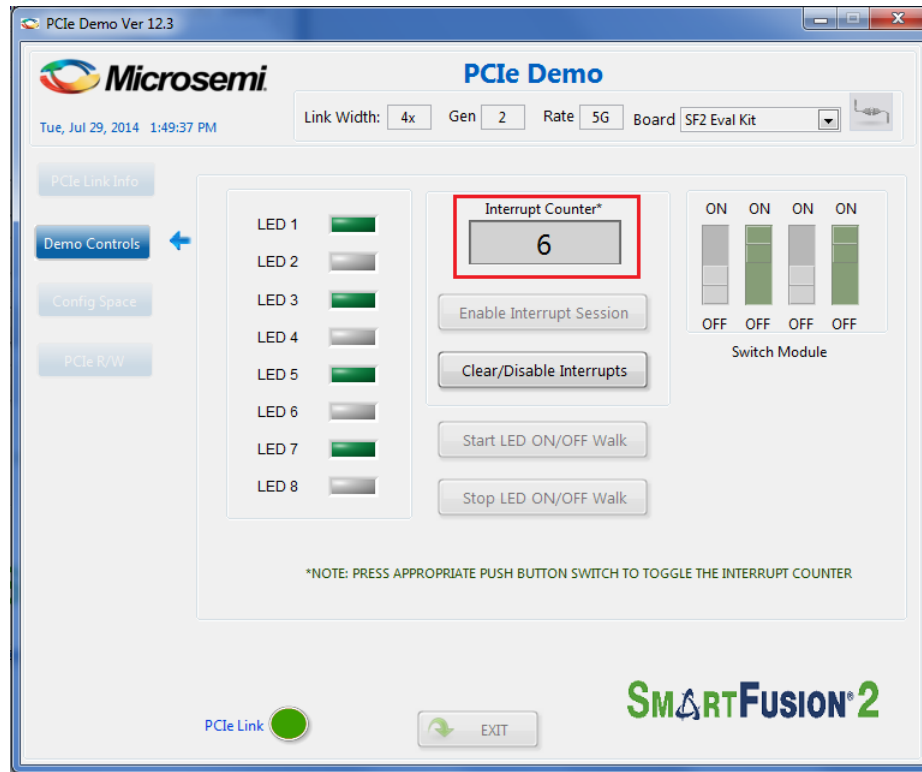

Figure 56 • Demo Controls

- Click the various LEDs appearing on GUI to switch ON and switch OFF the LEDs on the SmartFusion2 Security Evaluation board.
- Click **Start LED ON/OFF Walk** to make the LEDs on the board blink.
- Click **Stop LED ON/OFF Walk** to stop the blinking of LEDs.
- Change the position of DIP switches 1 to 4 on **SW5** of the board, and observe the position of those switches in **GUI SWITCH MODULE**.
- Click **Enable Interrupt Session** to enable the PCIe interrupt.

11. Press the **SW4** push-button switch on the SmartFusion2 Evaluation Board and observe the interrupt count in the **Interrupt Counter** field, shown in the following figure.

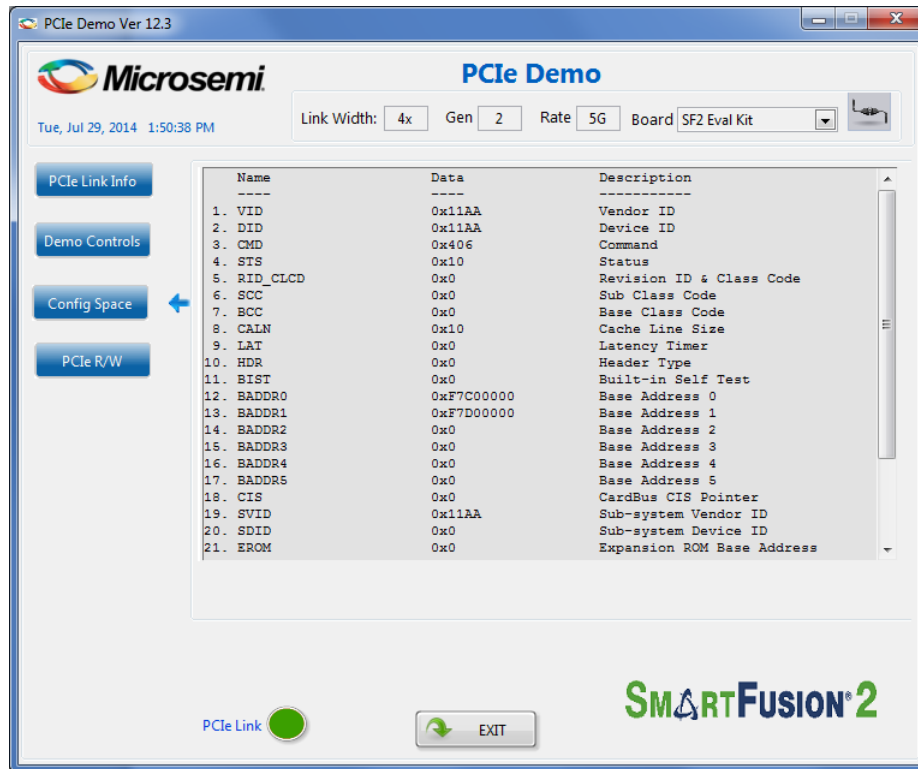

Figure 57 • Interrupt Counter

12. Click **Clear/Disable Interrupts** to clear and disable the PCIe interrupts.

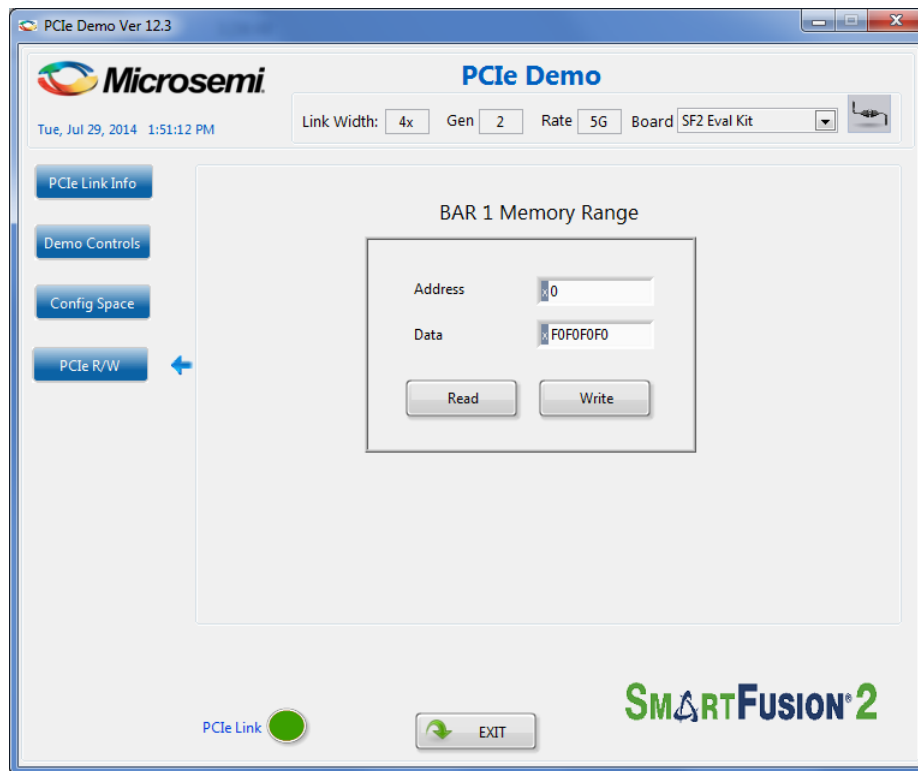

13. Click **Config Space** for details about the PCIe configuration space, as shown in the following figure.

Figure 58 • Configuration Space

14. Click **PCIe R/W** to perform read and writes to LSRAM memory through the **BAR1** space. The **PCIe R/W** window appears, as shown in the following figure.
15. In the **Address** field, enter an address in the 0x0000 to 0xFFFFC range in the **Address** field.
16. In the **Data** field, enter a 32-bit hexadecimal value.

Figure 59 • Read and Write to LSRAM Using PCIe

17. Click **Exit** to quit the demo.

Note: For running the demo design on Linux, see [DG0566: SmartFusion2 SoC FPGA PCIe Control Plane Demo For Advanced Dev Kit and Evaluation Kit Demo Guide](#).

10 Appendix: FPGA Programming Using FlashPro4

The M2S090TS-EVAL-KIT can be programmed and/or debugged using the FlashPro4 programmer.

10.1 Board Setup

The following figure is a snapshot of a sample setup of the SmartFusion2 Security Evaluation Board for FlashPro4 programming.

Figure 60 • SmartFusion2 Evaluation Board Setup for FlashPro4 Programming

Note: The notch (highlighted in red) does not go into the adapter card.

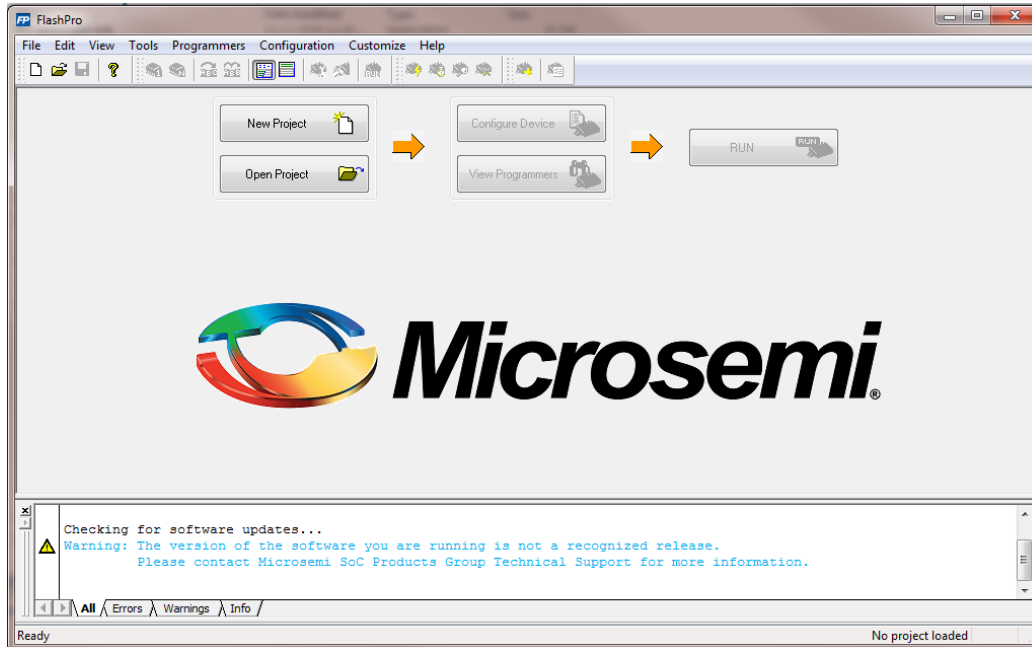

10.2 Programming the Device Using FlashPro4

FlashPro4 must be installed on the host PC to program the device using FlashPro4.

To program the board using FlashPro4, follow these steps:

1. Connect the FlashPro4 header to the **J5** jumper.
2. Switch ON the **SW7** power supply switch.
3. Open the FlashPro software.

Figure 61 • FlashPro Window

4. Click **New Project** to create a new project.
The **New Project** window appears, as shown in the following figure.

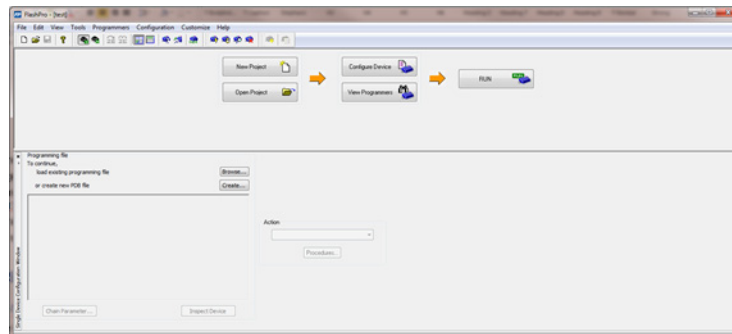

Figure 62 • Creating a New Project

5. Enter the **Project Name**.
6. **Select Single device** as the programming mode, and click **OK**.

7. Click **Configure Device**.

Figure 63 • Configuring the Device

8. Click **Browse**, and select the `M2S090_EVAL_KIT_MTD_top_rev1.stp` file from the **Load Programming File** window.
9. Click **Program** to program the device.
When the device is programmed successfully, a **Run Program PASSED** status is displayed.
