

Package Style: QFN, 16-pin, 3mmx3mmx0.5mm

### Features

- Integrated 2.4GHz to 2.5GHz b/g/n Amplifier, LNA, SP3T Switch, and Power Detector Coupler
- Single Supply Voltage 3.0V to 4.8V
- $P_{OUT} = 19.5\text{dBm}$ , 11g, OFDM at <3.3% EVM, 22dBm 11b Meeting 11b Spectral Mask
- Low Height Package, Suited for SiP and CoB Designs

### Applications

- Cellular handsets
- Mobile devices
- Tablets
- Consumer electronics
- Gaming
- Netbooks/Notebooks
- TV/monitors/video
- SmartEnergy

Functional Block Diagram

### Product Description

The RF5565 provides a complete integrated solution in a single Front End Module (FEM) for WiFi 802.11b/g/n and Bluetooth® systems. The ultra small form factor and integrated matching greatly reduces the number of external components and layout area in the customer application. This simplifies the total Front End solution by reducing the bill of materials, system footprint, and manufacturability cost. The RF5565 integrates a 2.4GHz Power Amplifier (PA), Low Noise Amplifier (LNA) with bypass mode, power detector coupler for improved accuracy, and some filtering for harmonic rejection. The device is provided in a 3mmx3mmx0.5mm, 16-pin package. This module meets or exceeds the RF Front End needs of IEEE 802.11b/g/n WiFi RF systems.

### Ordering Information

RF5565SQ	Standard 25 pieces sample bag
RF5565SR	Standard 100 pieces reel
RF5565TR7	Standard 2500 pieces reel
RF5565PCK-410	Fully assembled evaluation board with 5-piece bag

### Optimum Technology Matching® Applied

## Absolute Maximum Ratings

Parameter	Rating	Unit
DC Supply Voltage (Continuous with No Damage)	5.4	V
DC Supply Current	500	mA
Case Temperature (Full Spec. Compliant)	-10 to +70	°C
Extreme Operating Case Temperature (Reduced Performance)	-40 to -10 +70 to +85	°C
Storage Temperature	-40 to +150	°C
Maximum TX Input Power into 50Ω Load for 11b/g/n (No Damage)	0	dBm
Maximum RX Input Power (No Damage)	0	dBm
Moisture Sensitivity	MSL2	

**Caution!** ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EUDirective2002/95/EC (at time of this document revision).

Antenna to Bluetooth®	20			dB	In TX Mode (measured from ANT to BT port)
Antenna to Receive	20			dB	In TX Mode (measured from ANT to RX port)
Switch Control Voltage					C_RX, C_BT, and C_TX control lines
Low		0	0.2	V	Switch is in the low state (L)
High	3.0		3.6	V	Switch is in the high state (H)
Switch Control Current		2	10	μA	Per control line
LNA_EN Control Current		60	100	μA	Over V <sub>CC</sub> , Frequency and Temperature.
Switch Control Speed			10	nsec	
Switch P1dB		28		dBm	

Parameter	Specification			Unit	Condition
	Min.	Typ.	Max.		
<b>Other Requirements, cont.</b>					
ESD					
Human Body Model	500			V	EIA/JESD22-114A RF pins
	1000			V	EIA/JESD22-114A DC pins
Charge Device Model	500			V	JESD22-C101C all pins

Note 1: The PA module must operate with gated bias voltage input at 1% to 99% duty cycle.

Note 2: The output power for channels 1 and 11 may be reduced to meet FCC restricted band requirements.

### Switch Control Logic

Mode	C_TX	C_RX	C_BT	VREG	LNA_EN
Transmit	H	L	L	H	L
Receive	L	H	L	L	H
Bypass	L	H	L	L	L
Bluetooth	L	L	H	L	L
Standby	L	L	L	L	L
Logic Voltage Levels	H	3.0V to 3.6V			
	L	<0.2V			

Pin	Function	Description
1	TX_IN	RF input for the 802.11b/g PA. Input is matched to 50Ω and DC block is provided.
2	VREG	Regulated voltage for the bias control circuit. An external bypass capacitor may be needed on the V <sub>REG</sub> line for decoupling purposes.
3	RX OUT	Receive port for 802.11b/g band. Internally matched to 50Ω. DC block provided.
4	LNA VDD	Voltage supply for the LNA.
5	LNA_EN	Control voltage for the LNA. When this pin is set to a LOW logic state, the bypass mode is enabled.
6	C RX	Receive switch control pin. See switch truth table for proper level.
7	C_TX	Switch control voltage for the transmit branch. See logic control table for proper settings.
8	BT	RF bidirectional port for <i>Bluetooth</i> <sup>®</sup> . Input is matched to 50Ω and DC block is provided.
9	C_BT	<i>Bluetooth</i> <sup>®</sup> switch control pin. See truth table for proper level.
10	ANT	Port matched to 50Ω and is DC blocked internally.
11	GND	Ground.
12	N/C	No connect.
13	N/C	No connect.
14	VCC	Supply voltage for the PA.
15	VCC	Supply voltage for the PA.
16	PDETECT	Power detector voltage for TX section. PDET voltage varies with output power. May need external decoupling capacitor for noise bypassing. May need external circuitry to bring output voltage to desired level.

## Pin Out

**Package Drawing**

**NOTES:**

- 1 Shaded Area is Pin 1 Indicator

## RF5565 PCB Footprint and Stencil Recommendations

Shaded are represents Pin 1 location.

Thermal vias for center slug "B" should be incorporated into the PCB design. The number and size of thermal vias will depend on the application, the power dissipation, and the electrical requirements. Example of the number and size of vias can be found on the RFMD evaluation board layout.

**Evaluation Board Schematic**

## Theory of Operation

The RF5565 Front End Module (FEM) is designed for WiFi applications in the 2.5GHz ISM band. It can be applied in many portable applications such as handsets, Personal Media Players, and portable battery power equipment. This highly integrated module can be connected directly to the battery without additional voltage regulators.

### WiFi TRANSMIT MODE

The RF5565 requires a single positive supply ( $V_{CC}$ ), a positive supply for switch controls, and a regulated supply for the  $V_{REG}$  to maintain nominal bias current. The RF5565 transmit path has a typical gain of 30dB from 2.4GHz to 2.5GHz, and delivers 20dBm typical output power under 54Mbps OFDM modulation and 22dBm under 1Mbps 11b modulation. The RF5565 contains basic filter components to produce a bandpass response for the transmit path. Due to space constraints inside the module, filtering is limited to a few resonant poles and additional filters may be required depending upon the end-user's application. While in transmit mode, the active components are the Power Amplifier (PA) and the TX branch of the SP3T switch. Refer to the logic control table for proper settings.

### TX Biasing Instructions

- Connect the TX input to a signal generator and a spectrum analyzer at the Antenna output.
- Set  $V_{CC}$  to 3.3V with  $V_{REG}$  set to 0V.
- Turn  $V_{REG}$  ON and set voltage to 3.1V.  $V_{REG}$  controls the current drawn by the PA and it should quickly reach a quiescent current of approximately  $90\text{mA} \pm 20\text{mA}$ . Care must be exercised not to exceed 3.5V on the  $V_{REG}$  pin or the part may be damaged.
- Next set  $C_{TX}$  high. This pin controls the transmit branch of the SP3T.
- The SP3T controls for the off branches ( $C_{RX}$  and  $C_{BT}$ ) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance of the PA will degrade significantly. Likewise, unused RF Ports must be terminated in  $50\Omega$  to simulate actual system conditions and prevent RF signals from coupling back to the PA.
- Turn RF ON.

### WiFi RECEIVE MODE

Within the frequency band of operation 2.4GHz to 2.5GHz, the RF5565 WiFi receive path has a typical gain of 14dB and a NF of 2.2dB with about 12mA of current. In RX mode, only the RX branch of the SP3T and the LNA are active. Refer to the logic control table for proper settings.

### RX Biasing Instructions

- Connect the RX input (ANT/pin-10) to a signal generator and a spectrum analyzer at the RX output. A VNA may be used as well.
- Turn LNA voltage supply ON and set the voltage to 3.3V.
- Set  $C_{RX}$  and  $LNA_{EN}$  high. This turns the LNA and the receive branch of the SP3T ON.
- The SP3T controls for the off branches ( $C_{TX}$  and  $C_{BT}$ ) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance will degrade. It is recommended to terminate unused RF Ports in  $50\Omega$ .
- Turn RF ON.

**Bypass Mode for WiFi Receive Operation**

- Connect the RF input (ANT/pin-10) to a signal generator and a spectrum analyzer at the RX output. A multiport VNA may be used as well.
- Set LNA\_EN low. By applying a voltage  $<0.2V$  to this pin it enables the bypass switch of the LNA.
- Set C\_RX high. This turns the receive branch of the SP3T ON.
- The SP3T controls for the off branches (C\_TX and C\_BT) must be set to a logic “low” (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic “high” the performance will degrade. It is recommended to terminate unused RF Ports in  $50\Omega$ .
- Turn RF ON.

**BLUETOOTH® MODE**

The RF765 *Bluetooth*® only mode is implemented through the SP3T switch by setting C\_BT “high.” Typical insertion loss is about 1dB.

*Bluetooth*® Biasing Instructions

- Connect the RF input (ANT/pin-10) to a signal generator and a spectrum analyzer at the BT (pin-8) RF port. A VNA may be used in place of the Sig Gen and SA.
- Set C\_BT “high.” This turns the *Bluetooth*® branch of the SP3T switch ON.
- The SP3T controls for the off branches (C\_TX and C\_RX) must be set to a logic “low” (0.2V max) or grounded. Do not leave floating.
- Terminate unused RF Ports in  $50\Omega$ .
- Turn RF ON.

**APPLICATION CIRCUIT AND LAYOUT RECOMMENDATIONS**

The RF5565 integrates the matching networks and DC blocking capacitors for all RF ports. This greatly reduces the number of external components and layout area needed to implement this FEM. Typically only a total of four external components are required to achieve nominal performance. However, depending on board layout and the many noise signals that could potentially couple to the RF5565, additional bypassing capacitors may be required to properly filter out unwanted signals that might degrade performance.

The LNA bias components consist of an inductor and a decoupling capacitor. The inductor value is critical to optimize NF and return loss at the RX output. For best performance and trade off between critical parameters such as NF, Gain, and IP3, the total inductance including board trace should be approximately 1.2nH. The last components needed in the application circuit are low frequency bypass capacitors on the VCC line. In general, it is good RF practice to have proper decoupling of supply lines to filter noise out. Occasionally, depending on the level of coupling or parasitics of the board, a high frequency bypass capacitor must be added as well.

In order to optimize performance for both the Transmit and Receive paths, best known RF practices for PCB layout must be followed. All RF traces must be  $50\Omega$ . Adequate grounding along the RF traces and on the FEM ground slug must be exercised. This will minimize coupling and provide good thermal dissipation when the PA is operating at high power. For reference, RFMD evaluation board gerbers are available upon request.
