

SN65LVDS93A-Q1 FlatLink™ Transmitter

1 Features

- AEC-Q100 Qualified with:
 - Temperature Grade 3: –40°C to 85°C
 - HBM ESD Classification 3
 - CDM ESD Classification C6
- LVDS Display Series Interfaces Directly to LCD Display Panels With Integrated LVDS
- Package: 14-mm x 6.1-mm TSSOP
- 1.8-V Up to 3.3-V Tolerant Data Inputs to Connect Directly to Low-Power, Low-Voltage Application and Graphic Processors
- Transfer Rate up to 135 Mpps (Mega Pixel Per Second); Pixel Clock Frequency Range 10 MHz to 135 MHz
- Suited for Display Resolutions Ranging From HVGA up to HD With Low EMI
- Operates From a Single 3.3-V Supply and 170 mW (Typical) at 75 MHz
- 28 Data Channels Plus Clock in Low-Voltage TTL to 4 Data Channels Plus Clock Out Low-Voltage Differential
- Consumes Less Than 1 mW When Disabled
- Selectable Rising or Falling Clock Edge Triggered Inputs
- Support Spread Spectrum Clocking (SSC)
- Compatible with all OMAP™ 2x, OMAP™ 3x, and DaVinci™ Application Processors

2 Applications

- LCD Display Panel Driver
- UMPC and Netbook PC
- Digital Picture Frame

3 Description

The SN65LVDS93A-Q1 FlatLink™ transmitter contains four 7-bit parallel-load serial-out shift registers, a 7X clock synthesizer, and five Low-Voltage Differential Signaling (LVDS) line drivers in a single integrated circuit. These functions allow 28 bits of single-ended LVTTTL data to be synchronously transmitted over five balanced-pair conductors for receipt by a compatible receiver, such as the SN75LVDS94 and LCD panels with integrated LVDS receiver.

When transmitting, data bits D0 through D27 are each loaded into registers upon the edge of the input clock signal (CLKIN). The rising or falling edge of the clock can be selected via the clock select (CLKSEL) pin. The frequency of CLKIN is multiplied seven times, and then used to unload the data registers in 7-bit slices and serially. The four serial streams and a phase-locked clock (CLKOUT) are then output to LVDS output drivers. The frequency of CLKOUT is the same as the input clock, CLKIN.

The SN65LVDS93A-Q1 requires no external components and little or no control. The data bus appears the same at the input to the transmitter and output of the receiver with the data transmission transparent to the user(s). The only user intervention is selecting a clock rising edge by inputting a high level to CLKSEL or a falling edge with a low-level input, and the possible use of the Shutdown/Clear (SHTDN). SHTDN is an active-low input to inhibit the clock, and shut off the LVDS output drivers for lower power consumption. A low-level on this signal clears all internal registers to a low-level.

The SN65LVDS93A-Q1 is characterized for operation over ambient air temperatures of –40°C to 85°C.

Device Information⁽¹⁾

4 Revision History

Changes from Revision A (February 2015) to Revision B	Page
• Changed "Toggle LVDS83B" To "Toggle SN65LVDS93A-Q1" in item 4 in the Power Up Sequence section	17
• Changed "this allows the LVDS83B" To "this allows the SN65LVDS93A-Q1" in item 5 in the Power Up Sequence section	17

Changes from Original (February 2015) to Revision A	Page
• Changed Features From: HBM ESD Classification 2 To: HBM ESD Classification 3	1
• Deleted Features ESD: 5-kV HBM, 1.5-kV CDM	1

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CLKIN	31	CMOS IN with pulldn	Input pixel clock; rising or falling clock polarity is selectable by Control input CLKSEL.
CLKOUTP, CLKOUTM	39 40	LVDS Out	Differential LVDS pixel clock output. Output is high-impedance when SHTDN is pulled low (de-asserted).
CLKSEL	17	CMOS IN with pulldn	Selects between rising edge input clock trigger (CLKSEL = V _{IH}) and falling edge input clock trigger (CLKSEL = V _{IL}).
D5, D6, D7, D8 D9, D10, D11, D12 D13, D14, D15, D16 D17, D18, D19, D20 D21, D22, D23, D24 D25, D26, D27 D0, D1, D2, D3, D4	2, 3, 4, 6 7, 8, 10, 11 12, 14, 15, 16 18, 19, 20, 22 23, 24, 25, 27 28, 30, 50 51, 52, 54, 55, 56	CMOS IN with pulldn	Data inputs; supports 1.8 V to 3.3 V input voltage selectable by VDD supply. To connect a graphic source successfully to a display, the bit assignment of D[27:0] is critical (and not necessarily intuitive). For input bit assignment see Figure 15 to Figure 18 for details. Note: if application only requires 18-bit color, connect unused inputs D5, D10, D11, D16, D17, D23, and D27 to GND.
GND	5, 13, 21, 29, 33, 35, 36, 43, 49, 53	Power Supply ⁽¹⁾	Supply ground for VCC, IOVCC, LVDSVCC, and PLLVCC.

(1) For a multilayer pcb, it is recommended to keep one common GND layer underneath the device and connect all ground terminals directly to this plane.

SN65LVDS93A-Q1

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
IOVCC	1, 26	Power Supply ⁽¹⁾	I/O supply reference voltage (1.8 V up to 3.3 V matching the GPU data output signal swing)
LVDSVCC	44	Power Supply ⁽¹⁾	3.3 V LVDS output analog supply
PLLVC	34	Power Supply ⁽¹⁾	3.3 V PLL analog supply
$\overline{\text{SHTDN}}$	32	CMOS IN with pulldn	Device shut down; pull low (de-assert) to shut down the device (low power, resets all registers) and high (assert) for normal operation.
VCC	9	Power Supply ⁽¹⁾	3.3 V digital supply voltage
Y0P, Y0M Y1P, Y1M Y2P, Y2M	47, 48 45, 46 41, 42	LVDS Out	Differential LVDS data outputs. Outputs are high-impedance when $\overline{\text{SHTDN}}$ is pulled low (de-asserted)
Y3P, Y3M	37, 38	LVDS Out	Differential LVDS Data outputs. Output is high-impedance when $\overline{\text{SHTDN}}$ is pulled low (de-asserted). Note: if the application only requires 18-bit color, this output can be left open.

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

	MIN	MAX	UNIT
Supply voltage range, VCC, IOVCC, LVDSVCC, PLLVCC ⁽²⁾	–0.5	4	V
Voltage range at any output terminal	–0.5	VCC + 0.5	V
Voltage range at any input terminal	–0.5	IOVCC + 0.5	V
Continuous power dissipation	See Thermal Information		
Storage temperature, T _{stg}	–65	150	°C

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) All voltages are with respect to the GND terminals.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per AEC Q200-002 ⁽¹⁾	±4000	V
	Charged-device model (CDM), per AEC Q100-011	±1500	

- (1) AEC Q200-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	NOM	MAX	UNIT
Supply voltage, VCC		3	3.3	3.6	V
LVDS output Supply voltage, LVDSVCC		3	3.3	3.6	
PLL analog supply voltage, PLLVCC		3	3.3	3.6	
IO input reference supply voltage, IOVCC		1.62	1.8 / 2.5 / 3.3	3.6	
Power supply noise on any VCC terminal		0.1			
High-level input voltage, V _{IH}	IOVCC = 1.8 V	IOVCC/2 + 0.3 V			V
	IOVCC = 2.5 V	IOVCC/2 + 0.4 V			
	IOVCC = 3.3 V	IOVCC/2 + 0.5 V			
Low-level input voltage, V _{IL}	IOVCC = 1.8 V	IOVCC/2 - 0.3 V			V
	IOVCC = 2.5 V	IOVCC/2 - 0.4 V			
	IOVCC = 3.3 V	IOVCC/2 - 0.5 V			
Differential load impedance, Z _L		90		132	Ω
Operating free-air temperature, T _A		−40		85	°C
Virtual junction temperature, T _J				105	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DGG	UNIT
		56 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	63.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	15.9	
R _{θJB}	Junction-to-board thermal resistance	32.5	
Ψ _{JT}	Junction-to-top characterization parameter	0.4	
Ψ _{JB}	Junction-to-board characterization parameter	32.2	
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A

6.7 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
t_0	Delay time, CLKOUT↑ after Yn valid (serial bit position 0, equal D1, D9, D20, D5)	See Figure 10, $t_C = 10\text{ns}$, Input clock jitter < 25ps ⁽²⁾	-0.1	0	0.1	ns
t_1	Delay time, CLKOUT↑ after Yn valid (serial bit position 1, equal D0, D8, D19, D27)		$\frac{1}{7} t_C - 0.1$		$\frac{1}{7} t_C + 0.1$	ns
t_2	Delay time, CLKOUT↑ after Yn valid (serial bit position 2, equal D7, D18, D26, D23)		$\frac{2}{7} t_C - 0.1$		$\frac{2}{7} t_C + 0.1$	ns
t_3	Delay time, CLKOUT↑ after Yn valid (serial bit position 3; equal D6, D15, D25, D17)		$\frac{3}{7} t_C - 0.1$		$\frac{3}{7} t_C + 0.1$	ns
t_4	Delay time, CLKOUT↑ after Yn valid (serial bit position 4, equal D4, D14, D24, D16)		$\frac{4}{7} t_C - 0.1$		$\frac{4}{7} t_C + 0.1$	ns
t_5	Delay time, CLKOUT↑ after Yn valid (serial bit position 5, equal D3, D13, D22, D11)		$\frac{5}{7} t_C - 0.1$		$\frac{5}{7} t_C + 0.1$	ns
t_6	Delay time, CLKOUT↑ after Yn valid (serial bit position 6, equal D2, D12, D21, D10)		$\frac{6}{7} t_C - 0.1$		$\frac{6}{7} t_C + 0.1$	ns
$t_{C(O)}$	Output clock period			t_C		ns
$\Delta t_{C(O)}$	Output clock cycle-to-cycle jitter ⁽³⁾	$t_C = 10\text{ns}$; clean reference clock, see Figure 11		±26		ps
		$t_C = 10\text{ns}$ with 0.05UI added noise modulated at 3MHz, see Figure 11		±44		
		$t_C = 7.4\text{ns}$; clean reference clock, see Figure 11		±35		
		$t_C = 7.4\text{ns}$ with 0.05UI added noise modulated at 3MHz, see Figure 11		±42		
t_w	High-level output clock pulse duration			$\frac{4}{7} t_C$		ns
$t_{r/f}$	Differential output voltage transition time (t_r or t_f)	See Figure 7		225	500	ps
t_{en}	Enable time, $\overline{\text{SHTDN}}\uparrow$ to phase lock (Yn valid)	$f_{(\text{clk})} = 135\text{ MHz}$, See Figure 12		6		μs
t_{dis}	Disable time, $\overline{\text{SHTDN}}\downarrow$ to off-state (CLKOUT high-impedance)	$f_{(\text{clk})} = 135\text{ MHz}$, See Figure 13		7		ns

(1) All typical values are at $V_{CC} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$.

(2) |Input clock jitter| is the magnitude of the change in the input clock period.

(3) The output clock cycle-to-cycle jitter is the largest recorded change in the output clock period from one cycle to the next cycle observed over 15,000 cycles. Tektronix TDSJIT3 Jitter Analysis software was used to derive the maximum and minimum jitter value.

8 Detailed Description

8.1 Overview

FlatLink™ is an LVDS SerDes data transmission system. The SN65LVDS93A-Q1 takes in three (or four) data words each containing seven single-ended data bits and converts this to an LVDS serial output. Each serial output runs at seven times that of the parallel data rate. The deserializer (receiver) device operates in the reverse manner. The three (or four) LVDS serial inputs are transformed back to the original seven-bit parallel single-ended data. FlatLink™ devices are available in 21:3 or 28:4 SerDes ratios.

- The 21-bit devices are designed for 6-bit RGB video for a total of 18 bits in addition to three extra bits for horizontal synchronization, vertical synchronization, and data enable.
- The 28-bit devices are intended for 8-bit RGB video applications. Again, the extra four bits are for horizontal synchronization, vertical synchronization, data enable, and the remaining is the reserved bit. These 28-bit devices can also be used in 6-bit and 4-bit RGB applications as shown in the subsequent system diagrams.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 TTL Input Data

The data inputs to the transmitter come from the graphics processor and consist of up to 24 bits of video information, a horizontal synchronization bit, a vertical synchronization bit, an enable bit, and a spare bit. The data can be loaded into the registers upon either the rising or falling edge of the input clock selectable by the CLKSEL pin. Data inputs are 1.8 V to 3.3 V tolerant for the SN65LVDS93A-Q1 and can connect directly to low-power, low-voltage application and graphic processors. The bit mapping is listed in [Table 1](#).

Table 1. Pixel Bit Ordering

	RED	GREEN	BLUE
LSB	R0	G0	B0
	R1	G1	B1
	R2	G2	B2
4-bit MSB	R3	G3	B3
	R4	G4	B4
6-bit MSB	R5	G5	B5
	R6	G6	B6
8-bit MSB	R7	G7	B7

8.3.2 LVDS Output Data

The pixel data assignment is listed in [Table 2](#) for 24-bit, 18-bit, and 12-bit color hosts.

Table 2. Pixel Data Assignment

8.4 Device Functional Modes

8.4.1 Input Clock Edge

The transmission of data bits D0 through D27 occurs as each are loaded into registers upon the edge of the CLKIN signal, where the rising or falling edge of the clock may be selected via CLKSEL. The selection of a clock rising edge occurs by inputting a high level to CLKSEL, which is achieved by populating pull-up resistor to pull CLKSEL=high. Inputting a low level to select a clock falling edge is achieved by directly connecting CLKSEL to GND.

8.4.2 Low Power Mode

The SN65LVDS93A-Q1 can be put in low-power consumption mode by active-low input SHTDN#. Connecting pin SHTDN# to GND will inhibit the clock and shut off the LVDS output drivers for lower power consumption. A low-level on this signal clears all internal registers to a low-level. Populate a pull-up to VCC on SHTDN# to enable the device for normal operation.

Typical Application (continued)

9.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
VCC	3.3 V
VCCIO	1.8 V
CLKIN	Falling edge
SHTDN#	High
Format	18-bit GPU to 24-bit LCD

9.2.2 Detailed Design Procedure

9.2.2.1 Power Up Sequence

The SN65LVDS93A-Q1 does not require a specific power up sequence.

It is permitted to power up IOVCC while VCC, VCCPLL, and VCCLVDS remain powered down and connected to GND. The input level of the SHTDN during this time does not matter as only the input stage is powered up while all other device blocks are still powered down.

It is also permitted to power up all 3.3V power domains while IOVCC is still powered down to GND. The device will not suffer damage. However, in this case, all the I/Os are detected as logic HIGH, regardless of their true input voltage level. Hence, connecting SHTDN to GND will still be interpreted as a logic HIGH; the LVDS output stage will turn on. The power consumption in this condition is significantly higher than standby mode, but still lower than normal mode.

The user experience can be impacted by the way a system powers up and powers down an LCD screen. The following sequence is recommended:

Power up sequence (SN65LVDS93A-Q1 $\overline{\text{SHTDN}}$ input initially low):

1. Ramp up LCD power (maybe 0.5ms to 10ms) but keep backlight turned off.
2. Wait for additional 0-200ms to ensure display noise won't occur.
3. Enable video source output; start sending black video data.
4. Toggle SN65LVDS93A-Q1 shutdown to $\overline{\text{SHTDN}} = V_{IH}$.
5. Send >1ms of black video data; this allows the SN65LVDS93A-Q1 to be phase locked, and the display to show black data first.
6. Start sending true image data.
7. Enable backlight.

Power Down sequence (SN65LVDS93A-Q1 $\overline{\text{SHTDN}}$ input initially high):

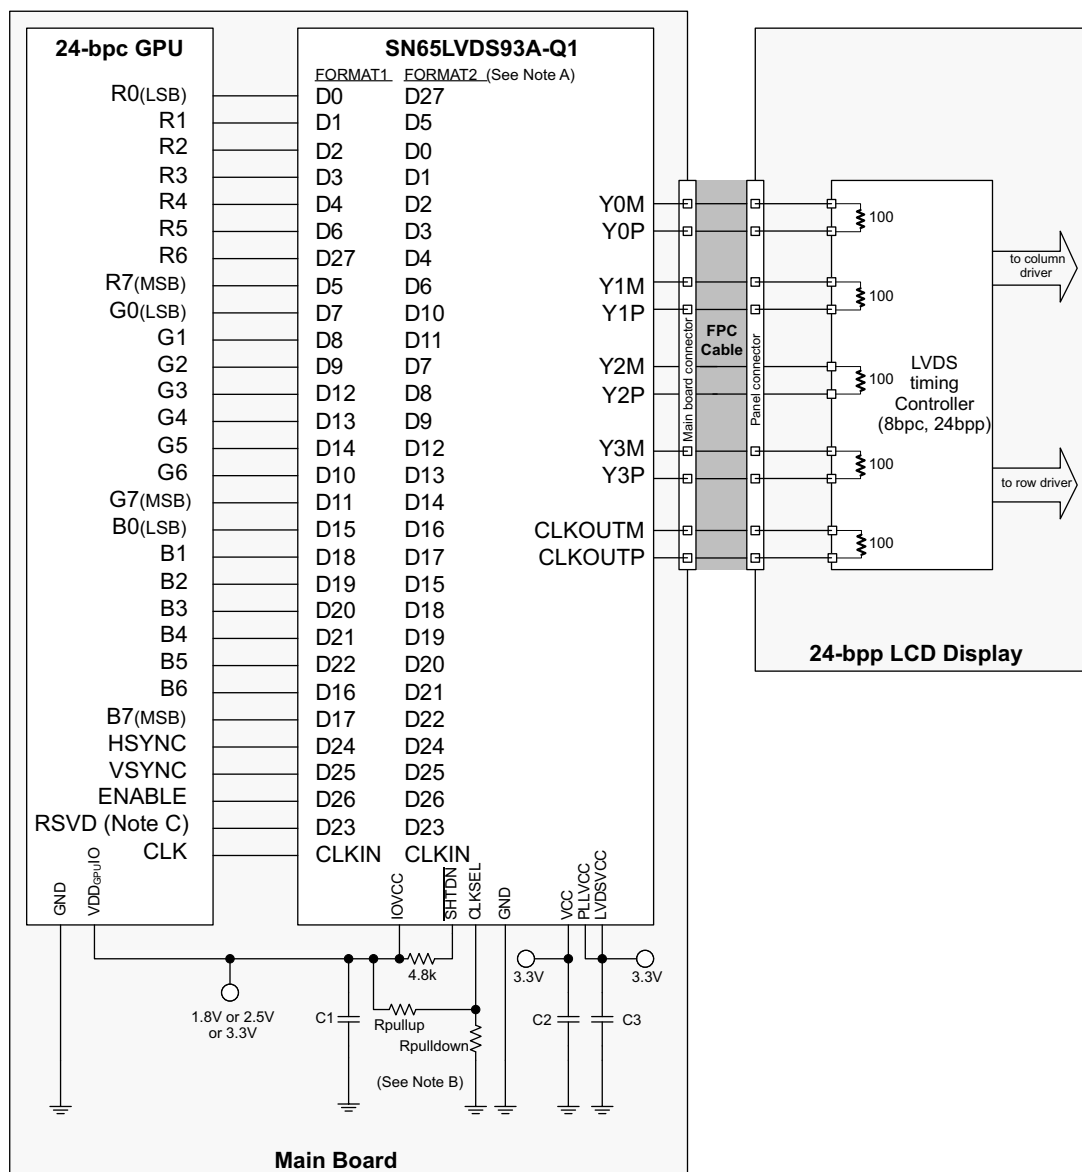

1. Disable LCD backlight; wait for the minimum time specified in the LCD data sheet for the backlight to go low.
2. Video source output data switch from active video data to black image data (all visible pixel turn black); drive this for >2 frame times.
3. Set SN65LVDS93A-Q1 input $\overline{\text{SHTDN}} = \text{GND}$; wait for 250ns.
4. Disable the video output of the video source.
5. Remove power from the LCD panel for lowest system power.

9.2.2.2 Signal Connectivity

While there is no formal industry standardized specification for the input interface of LVDS LCD panels, the industry has aligned over the years on a certain data format (bit order). [Figure 15](#) through [Figure 18](#) show how each signal should be connected from the graphic source through the SN65LVDS93A-Q1 input, output and LVDS LCD panel input. Detailed notes are provided with each figure.

SN65LVDS93A-Q1

SLLSEM1B – FEBRUARY 2015 – REVISED APRIL 2015

www.ti.com

Note A. **FORMAT**: The majority of 24-bit LCD display panels require the two most significant bits (2 MSB) of each color to be transferred over the 4th serial data output Y3. A few 24-bit LCD display panels require the two LSBs of each color to be transmitted over the Y3 output. The system designer needs to verify which format is expected by checking the LCD display data sheet.

- Format 1: use with displays expecting the 2 MSB to be transmitted over the 4th data channel Y3. This is the dominate data format for LCD panels.
- Format 2: use with displays expecting the 2 LSB to be transmitted over the 4th data channel.

Note B. **Rpullup**: install only to use rising edge triggered clocking.

Rpulldown: install only to use falling edge triggered clocking.

- C1: decoupling cap for the VDDIO supply; install at least 1x0.01μF.
- C2: decoupling cap for the VDD supply; install at least 1x0.1μF and 1x0.01μF.
- C3: decoupling cap for the VDDPLL and VDDLVD supply; install at least 1x0.1μF and 1x0.01μF.

Note C. If RSVD is not driven to a valid logic level, then an external connection to GND is recommended.

Note D. RSVD must be driven to a valid logic level. All unused SN65LVDS93A-Q1 inputs must be tied to a valid logic level.

Figure 15. 24-Bit Color Host to 24-Bit LCD Panel Application

Note A. Leave output Y3 NC.

Note B. **Rpullup**: install only to use rising edge triggered clocking.

Rpulldown: install only to use falling edge triggered clocking.

- C1: decoupling cap for the VDDIO supply; install at least 1x0.01μF.
- C2: decoupling cap for the VDD supply; install at least 1x0.1μF and 1x0.01μF.
- C3: decoupling cap for the VDDPLL and VDDLVDs supply; install at least 1x0.1μF and 1x0.01μF.

Figure 16. 18-Bit Color Host to 18-Bit Color LCD Panel Display Application

SN65LVDS93A-Q1

SLLSEM1B – FEBRUARY 2015 – REVISED APRIL 2015

www.ti.com

Note A. Leave output Y3 N.C.

Note B. **R3, G3, B3**: this MSB of each color also connects to the 5th bit of each color for increased dynamic range of the entire color space at the expense of none-linear step sizes between each step. For linear steps with less dynamic range, connect D1, D8, and D18 to GND.

R2, G2, B2: these outputs also connects to the LSB of each color for increased, dynamic range of the entire color space at the expense of none-linear step sizes between each step. For linear steps with less dynamic range, connect D0, D7, and D15 to VCC.

Note C. **R_{pullup}**: install only to use rising edge triggered clocking.

R_{pulldown}: install only to use falling edge triggered clocking.

- C1: decoupling cap for the VDDIO supply; install at least 1x0.01μF.
- C2: decoupling cap for the VDD supply; install at least 1x0.1μF and 1x0.01μF.
- C3: decoupling cap for the VDDPLL and VDDLVDs supply; install at least 1x0.1μF and 1x0.01μF.

Figure 17. 12-Bit Color Host to 18-Bit Color LCD Panel Display Application

Note A. Leave output Y3 NC.

Note B. **R0, R1, G0, G1, B0, B1**: For improved image quality, the GPU should dither the 24-bit output pixel down to 18-bit per pixel.

Note C. **Rpullup**: install only to use rising edge triggered clocking.

Rpulldown: install only to use falling edge triggered clocking.

- C1: decoupling cap for the VDDIO supply; install at least 1x0.01µF.
- C2: decoupling cap for the VDD supply; install at least 1x0.1µF and 1x0.01µF.
- C3: decoupling cap for the VDDPLL and VDDLVD supply; install at least 1x0.1µF and 1x0.01µF.

Figure 18. 24-Bit Color Host to 18-Bit Color LCD Panel Display Application

9.2.2.3 PCB Routing

Figure 19 shows a possible breakout of the data input and output signals on two layers of a printed circuit board.

Figure 19. Printed Circuit Board Routing Example (See Figure 14 for the Schematic)

9.2.3 Application Curve

Figure 20. 18b GPU to 24b LCD

10 Power Supply Recommendations

Power supply PLL, IO, and LVDS pins must be uncoupled from each.

11 Layout

11.1 Layout Guidelines

11.1.1 Board Stackup

There is no fundamental information about how many layers should be used and how the board stackup should look. Again, the easiest way to get good results is to use the design from the EVMs of Texas Instruments. The magazine *Elektronik Praxis* has published an article with an analysis of different board stackups. These are listed in [Table 3](#). Generally, the use of microstrip traces needs at least two layers, whereas one of them must be a GND plane. Better is the use of a four-layer PCB, with a GND and a VCC plane and two signal layers. If the circuit is complex and signals must be routed as stripline, because of propagation delay and/or characteristic impedance, a six-layer stackup should be used.

Table 3. Possible Board Stackup on a Four-Layer PCB

	MODEL 1	MODEL 2	MODEL 3	MODEL 4
Layer 1	SIG	SIG	SIG	GND
Layer 2	SIG	GND	GND	SIG
Layer 3	VCC	VCC	SIG	VCC
Layer 4	GND	SIG	VCC	SIG
Decoupling	Good	Good	Bad	Bad
EMC	Bad	Bad	Bad	Bad
Signal Integrity	Bad	Bad	Good	Bad
Self Disturbance	Satisfaction	Satisfaction	Satisfaction	High

11.1.2 Power and Ground Planes

A complete ground plane in high-speed design is essential. Additionally, a complete power plane is recommended as well. In a complex system, several regulated voltages can be present. The best solution is for every voltage to have its own layer and its own ground plane. But this would result in a huge number of layers just for ground and supply voltages. What are the alternatives? Split the ground planes and the power planes? In a mixed-signal design, e.g., using data converters, the manufacturer often recommends splitting the analog ground and the digital ground to avoid noise coupling between the digital part and the sensitive analog part. Take care when using split ground planes because:

- Split ground planes act as slot antennas and radiate.
- A routed trace over a gap creates large loop areas, because the return current cannot flow beside the signal, and the signal can induce noise into the nonrelated reference plane ([Figure 21](#)).
- With a proper signal routing, crosstalk also can arise in the return current path due to discontinuities in the ground plane. Always take care of the return current ([Figure 22](#)).

For [Figure 22](#), do not route a signal referenced to digital ground over analog ground and vice versa. The return current cannot take the direct way along the signal trace and so a loop area occurs. Furthermore, the signal induces noise, due to crosstalk (dotted red line) into the analog ground plane.

Figure 21. Loop Area and Crosstalk Due to Poor Signal Routing and Ground Splitting

Figure 22. Crosstalk Induced by the Return Current Path

11.1.3 Traces, Vias, and Other PCB Components

A right angle in a trace can cause more radiation. The capacitance increases in the region of the corner, and the characteristic impedance changes. This impedance change causes reflections.

- Avoid right-angle bends in a trace and try to route them at least with two 45° corners. To minimize any impedance change, the best routing would be a round bend (see [Figure 23](#)).
- Separate high-speed signals (e.g., clock signals) from low-speed signals and digital from analog signals; again, placement is important.
- To minimize crosstalk not only between two signals on one layer but also between adjacent layers, route them with 90° to each other.

Figure 23. Poor and Good Right Angle Bends

12 Device and Documentation Support

12.1 Trademarks

OMAP, DaVinci, FlatLink are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65LVDS93AIDGGRQ1	ACTIVE	TSSOP	DGG	56	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	LVDS93AQ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
