1 Description

CoolMOS™ C7 is a revolutionary technology for high voltage power MOSFETs, designed according to the superjunction (SJ) principle and pioneered by Infineon Technologies.

600V CoolMOS™ C7 series combines the experience of the leading SJ MOSFET supplier with high class innovation.

The 600V C7 is the first technology ever with $R_{DS(on)} \cdot A$ below $10\text{m}\Omega \cdot \text{mm}^2$.

Features

- Suitable for hard and soft switching (PFC and high performance LLC)
- Increased MOSFET dv/dt ruggedness to 120V/ns
- Increased efficiency due to best in class FOM $R_{DS(on)} \cdot E_{oss}$ and $R_{DS(on)} \cdot Q_g$
- Best in class $R_{DS(on)}$ /package
- Qualified for industrial grade applications according to JEDEC (J-STD20 and JESD22)

Benefits

- Increased economies of scale by use in PFC and PWM topologies in the application
- Higher dv/dt limit enables faster switching leading to higher efficiency
- Enabling higher system efficiency by lower switching losses
- Increased power density solutions due to smaller packages
- Suitable for applications such as server, telecom and solar
- Higher switching frequencies possible without loss in efficiency due to low E_{oss} and Q_g

Applications

PFC stages and PWM stages (TTF, LLC) for high power/performance SMPS e.g. Computing, Server, Telecom, UPS and Solar.

Please note: For MOSFET paralleling the use of ferrite beads on the gate or separate totem poles is generally recommended.

6 Test Circuits

Table 8 Diode characteristics

Figure 1 consists of two parts. The left part is a schematic diagram of a test circuit for diode characteristics. It shows two diodes connected in series, each with a gate resistor R_{g1} and R_{g2} . The diodes are connected to a common load inductor. The forward current I_F is measured through the inductor. The forward voltage V_{DS} is measured across the diodes. The reverse voltage $V_{DS(peak)}$ is measured across the diodes during reverse recovery. The right part is a graph of the diode recovery waveform. It shows the forward current I_F and reverse current I_{rm} versus time t . The forward voltage V_{DS} and reverse voltage $V_{DS(peak)}$ are also shown. The forward recovery time t_F is the time from the start of the forward current to the start of the reverse current. The reverse recovery time t_{rr} is the time from the start of the reverse current to the end of the reverse current. The storage time t_s is the time from the end of the reverse current to the start of the forward current. The forward charge Q_F and reverse charge Q_S are also indicated. The total reverse charge $Q_{rr} = Q_F + Q_S$ is shown. The forward current I_F is constant at I_F during the forward recovery time t_F . The reverse current I_{rm} is constant at I_{rm} during the reverse recovery time t_{rr} . The storage time t_s is the time from the end of the reverse current to the start of the forward current. The forward voltage V_{DS} is constant at V_{DS} during the forward recovery time t_F . The reverse voltage $V_{DS(peak)}$ is constant at $V_{DS(peak)}$ during the reverse recovery time t_{rr} . The storage time t_s is the time from the end of the reverse current to the start of the forward current. The forward charge Q_F and reverse charge Q_S are also indicated. The total reverse charge $Q_{rr} = Q_F + Q_S$ is shown.

Table 9 Switching times

Switching times test circuit for inductive load	Switching times waveform
 The circuit diagram illustrates a switching test setup for an inductive load. A MOSFET is driven by a pulse source through a gate resistor. The drain is connected to an inductor, which is in series with a load capacitor. A freewheeling diode is connected in parallel with the inductor. The drain-source voltage V_{DS} and gate-source voltage V_{GS} are indicated at measurement points.	 The timing diagram shows the relationship between the drain-source voltage V_{DS} and the gate-source voltage V_{GS} during switching transitions. Key parameters are defined: $t_{d(on)}$: Delay time from 10% V_{GS} to 90% V_{DS}. t_r: Rise time of V_{DS} from 90% to 100%. t_{on}: Total turn-on time from 10% V_{GS} to 100% V_{DS}. $t_{d(off)}$: Delay time from 90% V_{DS} to 10% V_{GS}. t_f: Fall time of V_{DS} from 90% to 10%. t_{off}: Total turn-off time from 90% V_{DS} to 10% V_{GS}.
