

INA20x High-Side Measurement Current-Shunt Monitor With Open-Drain Comparator and Reference

1 Features

- Complete Current Sense Solution
- Three gain Options Available:
 - INA200 = 20 V/V
 - INA201 = 50 V/V
 - INA202 = 100 V/V
- 0.6-V Internal Voltage Reference
- Internal Open-Drain Comparator
- Latching Capability on Comparator
- Common-Mode Range: –16 V to 80 V
- High Accuracy: 3.5% Maximum Error Over Temperature
- Bandwidth: 500 kHz (INA200)
- Quiescent Current: 1800 μ A (maximum)
- Packages: SOIC-8, VSSOP-8

2 Applications

- Notebook Computers
- Cell Phones
- Telecom Equipment
- Automotive
- Power Management
- Battery Chargers
- Welding Equipment

3 Description

The INA200, INA201, and INA202 devices are high-side current-shunt monitors with voltage output and integrated comparator. The INA200–INA202 devices can sense drops across shunts at common-mode voltages from –16 V to 80 V. The INA200–INA202 devices are available with three output voltage scales: 20 V/V, 50 V/V, and 100 V/V, with a bandwidth up to 500-kHz.

The INA200, INA201, and INA202 devices also incorporate an open-drain comparator and internal reference providing a 0.6-V threshold. External dividers are used to set the current trip point. The comparator includes a latching capability, which can be made transparent by grounding (or leaving open) the RESET pin.

The INA200, INA201, and INA202 devices operate from a single 2.7-V to 18-V supply, drawing a maximum of 1800 μ A of supply current. Package options include the very small VSSOP-8 and the SOIC-8. All versions are specified over the extended operating temperature range of –40°C to 125°C.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA200	SOIC (8)	4.90 mm x 3.91 mm
INA201	VSSOP (8)	3.00 mm x 3.00 mm
INA202		

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Changes from Revision C (October 2010) to Revision D	Page
<ul style="list-style-type: none"> • Added <i>ESD Ratings</i> table, <i>Thermal Information</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i>, <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section 	4

Changes from Revision B (October, 2007) to Revision C	Page
<ul style="list-style-type: none"> • Changed title of data sheet..... • Updated document format to current standards..... • Revised front-page figure 	1 1 1

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V_s	Analog	Power supply
2	OUT	Analog output	Output Voltage
3	CMP_{IN}	Analog input	Comparator input
4	GND	Analog	Ground
5	\overline{RESET}	Analog input	Comparator reset pin, active low
6	CMP_{OUT}	Analog output	Comparator output
7	V_{IN-}	Analog input	Connect to shunt low side
8	V_{IN+}	Analog input	Connect to shunt high side

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply Voltage, V_s		2.7	18	V
Current-Shunt Monitor Analog Inputs, V_{IN+} , V_{IN-}	Differential (V_{IN+}) – (V_{IN-})	–18	18	V
	Common Mode ⁽²⁾	–16	80	V
Comparator Analog Input and Reset Pins ⁽²⁾		GND – 0.3	$(V_s) + 0.3$	V
Analog Output, OUT ⁽²⁾		GND – 0.3	$(V_s) + 0.3$	V
Comparator Output, CMP_{OUT} ⁽²⁾		GND – 0.3	18	V
Input Current Into Any Pin ⁽²⁾			5	mA
Operating Temperature		–55	150	°C
Junction Temperature		–65	150	°C
Storage Temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) This voltage may exceed the ratings shown if the current at that pin is limited to 5 mA.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±4000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CM}	Common-mode input voltage	-16	12	80	V
V_S	Operating supply voltage	2.7	12	18	V
T_A	Operating free-air temperature	-40	25	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	INA20x		UNIT	
	D (SOIC)	DGK (SOIC)		
	8 PINS	8 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	110.5	162.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	50.4	37.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	52.7	82.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	7.8	1.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	51.9	81.4	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics: Current-Shunt Monitor

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = \text{GND}$, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
INPUT						
V_{SENSE}	Full-scale sense input voltage	$V_{SENSE} = V_{IN+} - V_{IN-}$		0.15	$(V_S - 0.25) / \text{Gain}$ V	
V_{CM}	Common-mode input range	$T_A = -40^\circ\text{C}$ to 125°C		-16	80 V	
CMR	Common-mode rejection	$V_{IN+} = -16\text{ V}$ to 80 V		80	100	dB
		$V_{IN+} = 12\text{ V}$ to 80 V , $T_A = -40^\circ\text{C}$ to 125°C		100	123	
V_{OS}	Offset voltage, RTI ⁽¹⁾	$T_A = 25^\circ\text{C}$		±0.5	±2.5	mV
		$T_A = 25^\circ\text{C}$ to 125°C		±3		
		$T_A = -40^\circ\text{C}$ to 25°C		±3.5		mV
dV_{OS}/dT	Offset voltage, RTI, vs temperature	T_{MIN} to T_{MAX} , $T_A = -40^\circ\text{C}$ to 125°C		5	µV/°C	
PSR	Offset voltage, RTI, vs power supply	$V_{OUT} = 2\text{ V}$, $V_{IN+} = 18\text{ V}$, 2.7 V , $T_A = -40^\circ\text{C}$ to 125°C		2.5	100	µV/V
I_B	Input bias current, V_{IN-} pin	$T_A = -40^\circ\text{C}$ to 125°C		±9	±16	µA

(1) Offset is extrapolated from measurements of the output at 20-mV and 100-mV V_{SENSE} .

Electrical Characteristics: Current-Shunt Monitor (continued)

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = \text{GND}$, unless otherwise noted.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
OUTPUT ($V_{SENSE} \geq 20\text{ mV}$)

NOISE, RTI							
	Voltage noise density				40		nV/ $\sqrt{\text{Hz}}$

(2) Total output error includes effects of gain error and V_{OS} .

(3) Linearity is best fit to a straight line.

(4) For details on this region of operation, see the [Accuracy Variations](#) section in the [Device Functional Modes](#).

(5) See [Figure 8](#).

(6) Specified by design.

6.6 Electrical Characteristics: Comparator

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, and $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE					
Threshold	$T_A = 25^\circ\text{C}$	590	608	620	mV
	$T_A = -40^\circ\text{C}$ to 125°C	586		625	mV
Hysteresis ⁽¹⁾	$T_A = -40^\circ\text{C}$ to 85°C		-8		mV
INPUT BIAS CURRENT⁽²⁾					
Input bias current, VMP_{in} PIN			0.005	10	nA
Input bias current, VMP_{in} PIN, vs temperature	$T_A = -40^\circ\text{C}$ to 125°C			15	nA
INPUT VOLTAGE RANGE					
Input voltage range, VMP_{in} PIN			0 V to $V_S - 1.5\text{ V}$		V
OUTPUT (OPEN-DRAIN)					
Large-signal differential voltage gain	$CMP\ V_{OUT} 1\text{ V}$ to 4 V , $R_L \geq 15\text{ k}\Omega$ Connected to 5 V		200		V/mV
I_{LKG} High-level leakage current ⁽³⁾⁽⁴⁾	$V_{ID} = 0.4\text{ V}$, $V_{OH} = V_S$		0.0001	1	μA
V_{OL} Low-level output voltage ⁽³⁾	$V_{ID} = -0.6\text{ V}$, $I_{OL} = 2.35\text{ mA}$		220	300	mV
RESPONSE TIME					
Response time ⁽⁵⁾	R_L to 5 V , $C_L = 15\text{ pF}$, 100-mV Input Step with 5-mV Overdrive		1.3		μs
RESET					
RESET threshold ⁽⁶⁾			1.1		V
Logic input impedance			2		$\text{M}\Omega$
Minimum RESET pulse width			1.5		μs
RESET propagation delay			3		μs

- (1) Hysteresis refers to the threshold (the threshold specification applies to a rising edge of a noninverting input) of a falling edge on the noninverting input of the comparator; refer to [Figure 1](#).
- (2) Specified by design.
- (3) V_{ID} refers to the differential voltage at the comparator inputs.
- (4) Open-drain output can be pulled to the range of 2.7 to 18 V , regardless of V_S .
- (5) The comparator response time specified is the interval between the input step function and the instant when the output crosses 1.4 V .
- (6) The RESET input has an internal $2\text{ M}\Omega$ (typical) pull-down. Leaving RESET open results in a LOW state, with transparent comparator operation.

6.7 Electrical Characteristics: General

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = 1\text{ V}$, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY					
V_S Operating power supply	$T_A = -40^\circ\text{C}$ to 125°C	2.7		18	V
I_Q Quiescent current	$V_{OUT} = 2\text{ V}$		1350	1800	μA
	$V_{SENSE} = 0\text{ mV}$, $T_A = -40^\circ\text{C}$ to 125°C			1850	μA
Comparator power-on reset threshold ⁽¹⁾			1.5		V
TEMPERATURE					
Specified temperature		-40		125	$^\circ\text{C}$
Operating temperature		-55		150	$^\circ\text{C}$
Storage temperature		-65		150	$^\circ\text{C}$
θ_{JA} Thermal resistance	VSSOP-8 Surface-Mount		200		$^\circ\text{C}/\text{W}$
	SOIC-8		150		$^\circ\text{C}/\text{W}$

- (1) The INA200, INA201, and INA202 are designed to power-up with the comparator in a defined reset state as long as RESET is open or grounded. The comparator is in reset as long as the power supply is below the voltage shown here. The comparator assumes a state based on the comparator input above this supply voltage. If RESET is high at power-up, the comparator output comes up high and requires a reset to assume a low state, if appropriate.

7 Detailed Description

7.1 Overview

The INA200, INA201, and INA202 devices are high-side current-shunt monitors with voltage output. The INA200–INA202 devices can sense drops across shunts at common-mode voltages from -16 V to 80 V . The INA200–INA202 devices are available with three output voltage scales: 20 V/V , 50 V/V , and 100 V/V , with up to 500-kHz bandwidth. The INA200, INA201, and INA202 devices also incorporate an open-drain comparator and internal reference providing a 0.6-V threshold. External dividers are used to set the current trip point. The comparator includes a latching capability, which can be made transparent by grounding (or leaving open) the RESET pin. The INA200, INA201, and INA202 devices operate from a single 2.7 to 18-V supply, drawing a maximum of $1800\text{ }\mu\text{A}$ of supply current. Package options include the very small MSOP-8 and the SO-8. All versions are specified over the extended operating temperature range of -40°C to 125°C .

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Basic Connections

[Figure 26](#) shows the basic connections of the INA200, INA201, and INA202 devices. The input pins, V_{IN+} and V_{IN-} , should be connected as closely as possible with kelvin connections to the shunt resistor to minimize any resistance in series with the shunt resistance.

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

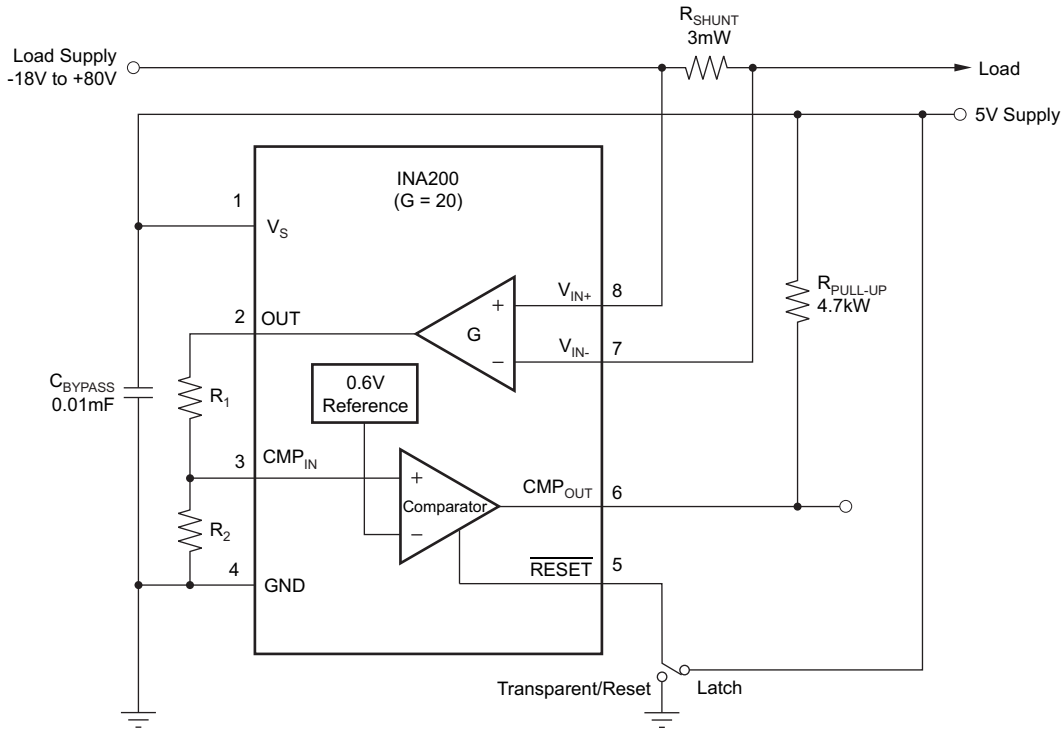

Figure 26. INA200 Basic Connections

7.3.2 Selecting R_S

The value chosen for the shunt resistor, R_S , depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply line. For most applications, best performance is attained with an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV. Maximum input voltage for accurate measurements is 500 mV, but output voltage is limited by supply.

7.3.3 Comparator

The INA200, INA201, and INA202 devices incorporate an open-drain comparator. This comparator typically has 2 mV of offset and a 1.3- μ s (typical) response time. The output of the comparator latches and is reset through the RESET pin; see Figure 28.

Figure 27. Input Filter (Gain Error: 1.5% to 2.8%)

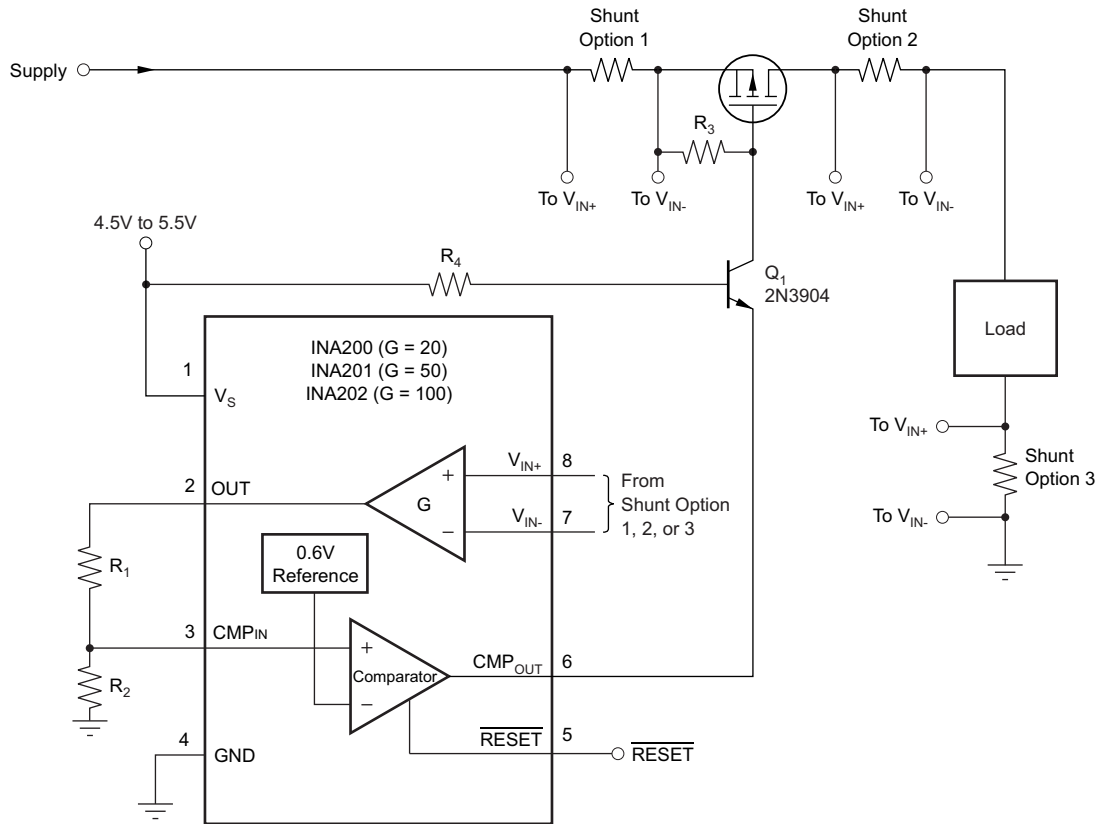

Figure 28. Comparator Latching Capability

NOTE: Q₁ cascodes the comparator output to drive a high-side FET (the 2N3904 shown is good up to 60V). The shunt could be located in any one of the three locations shown. The latching capability should be used in shutdown applications to prevent oscillation at the trip point.

Figure 29. High-Side Switch Overcurrent Shutdown

NOTE: It is possible to set different limits for each direction.

Figure 30. Bidirectional Overcurrent Comparator

7.4 Device Functional Modes

7.4.1 Input Filtering

An obvious and straightforward location for filtering is at the output of the INA200, INA201, and INA202 series; however, this location negates the advantage of the low output impedance of the internal buffer. The only other option for filtering is at the input pins of the INA200, INA201, and INA202 devices, which is complicated by the internal 5 kΩ + 30% input impedance; this is illustrated in [Figure 27](#). Using the lowest possible resistor values minimizes both the initial shift in gain and effects of tolerance. The effect on initial gain is given by [Equation 1](#):

$$\text{Gain Error \%} = 100 - \left(100 \times \frac{5\text{k}\Omega}{5\text{k}\Omega + R_{\text{FILT}}} \right) \quad (1)$$

Total effect on gain error can be calculated by replacing the 5-kΩ term with 5 kΩ – 30%, (or 3.5 kΩ) or 5 kΩ + 30% (or 6.5 kΩ). The tolerance extremes of R_{FILT} can also be inserted into the equation. If a pair of 100 Ω 1% resistors are used on the inputs, the initial gain error will be 1.96%. Worst-case tolerance conditions will always occur at the lower excursion of the internal 5-kΩ resistor (3.5 kΩ), and the higher excursion of R_{FILT} – 3% in this case.

The specified accuracy of the INA200, INA201, and INA202 devices must then be combined in addition to these tolerances. While this discussion treated accuracy worst-case conditions by combining the extremes of the resistor values, it is appropriate to use geometric mean or root sum square calculations to total the effects of accuracy variations.

7.4.2 Accuracy Variations as a Result of V_{SENSE} and Common-Mode Voltage

The accuracy of the INA200, INA201, and INA202 current shunt monitors is a function of two main variables: V_{SENSE} (V_{IN+} – V_{IN-}) and common-mode voltage, V_{CM}, relative to the supply voltage, V_S. V_{CM} is expressed as (V_{IN+} + V_{IN-})/2; however, in practice, V_{CM} is seen as the voltage at V_{IN+} because the voltage drop across V_{SENSE} is usually small.

This section addresses the accuracy of these specific operating regions:

- Normal Case 1: V_{SENSE} ≥ 20 mV, V_{CM} ≥ V_S
- Normal Case 2: V_{SENSE} ≥ 20 mV, V_{CM} < V_S
- Low V_{SENSE} Case 1: V_{SENSE} < 20 mV, –16 V ≤ V_{CM} < 0
- Low V_{SENSE} Case 2: V_{SENSE} < 20 mV, 0 V ≤ V_{CM} ≤ V_S
- Low V_{SENSE} Case 3: V_{SENSE} < 20 mV, V_S < V_{CM} ≤ 80 V

7.4.2.1 Normal Case 1: V_{SENSE} ≥ 20 mV, V_{CM} ≥ V_S

This region of operation provides the highest accuracy. Here, the input offset voltage is characterized and measured using a two-step method. First, the gain is determined by [Equation 2](#).

$$G = \frac{V_{\text{OUT1}} - V_{\text{OUT2}}}{100\text{mV} - 20\text{mV}}$$

where

- V_{OUT1} = Output Voltage with V_{SENSE} = 100 mV
 - V_{OUT2} = Output Voltage with V_{SENSE} = 20 mV
- (2)

Then the offset voltage is measured at V_{SENSE} = 100 mV and referred to the input (RTI) of the current shunt monitor, as shown in [Electrical Characteristics: Current-Shunt Monitor](#).

$$V_{\text{OSRTI}} (\text{Referred-To-Input}) = \left[\frac{V_{\text{OUT1}}}{G} \right] - 100\text{mV} \quad (3)$$

In the [Typical Characteristics, Figure 7](#) curve shows the highest accuracy for the this region of operation. In this plot, V_S = 12 V; for V_{CM} ≥ 12 V, the output error is at its minimum. This case is also used to create the V_{SENSE} ≥ 20-mV output specifications in [Electrical Characteristics: Current-Shunt Monitor](#).

Device Functional Modes (continued)

7.4.2.2 Normal Case 2: $V_{SENSE} \geq 20\text{ mV}$, $V_{CM} < V_S$

This region of operation has slightly less accuracy than Normal Case 1 as a result of the common-mode operating area in which the part functions, as seen in the [Figure 7](#) curve ([Figure 7](#)). As noted, for this graph $V_S = 12\text{ V}$; for $V_{CM} < 12\text{ V}$, the Output Error increases as V_{CM} becomes less than 12 V , with a typical maximum error of 0.005% at the most negative $V_{CM} = -16\text{ V}$.

7.4.2.3 Low V_{SENSE} Case 1: $V_{SENSE} < 20\text{ mV}$, $-16\text{ V} \leq V_{CM} < 0$; and Low V_{SENSE} Case 3: $V_{SENSE} < 20\text{ mV}$, $V_S < V_{CM} \leq 80\text{ V}$

Although the INA200 family of devices are not designed for accurate operation in either of these regions, some applications are exposed to these conditions. For example, when monitoring power supplies that are switched on and off while V_S is still applied to the INA200, INA201, or INA202 devices, it is important to know what the behavior of the devices will be in these regions.

As V_{SENSE} approaches 0 mV, in these V_{CM} regions, the device output accuracy degrades. A larger-than-normal offset can appear at the current shunt monitor output with a typical maximum value of $V_{OUT} = 300\text{ mV}$ for $V_{SENSE} = 0\text{ mV}$. As V_{SENSE} approaches 20 mV, V_{OUT} returns to the expected output value with accuracy as specified in the [Electrical Characteristics: Current-Shunt Monitor](#). [Figure 31](#) illustrates this effect using the INA202 (Gain = 100).

Figure 31. Example For Low V_{SENSE} Cases 1 and 3 (INA202, Gain = 100)

7.4.2.4 Low V_{SENSE} Case 2: $V_{SENSE} < 20\text{ mV}$, $0\text{ V} \leq V_{CM} \leq V_S$

This region of operation is the least accurate for the INA200 family. To achieve the wide input common-mode voltage range, these devices use two op amp front ends in parallel. One op amp front end operates in the positive input common-mode voltage range, and the other in the negative input region. For this case, neither of these two internal amplifiers dominates and overall loop gain is very low. Within this region, V_{OUT} approaches voltages close to linear operation levels for Normal Case 2. This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V. Within this region, as V_{SENSE} approaches 20 mV, device operation is closer to that described by Normal Case 2. [Figure 32](#) illustrates this behavior for the INA202. The V_{OUT} maximum peak for this case is tested by maintaining a constant V_S , setting $V_{SENSE} = 0\text{ mV}$ and sweeping V_{CM} from 0 V to V_S . The exact V_{CM} at which V_{OUT} peaks during this test varies from part to part, but the V_{OUT} maximum peak is tested to be less than the specified V_{OUT} tested limit.

Device Functional Modes (continued)

NOTE: (1) INA200 V_{OUT} Tested Limit = 0.4V. INA201 V_{OUT} Tested Limit = 1V.

Figure 32. Example For Low V_{SENSE} Case 2 (INA202, Gain = 100)

7.4.3 Transient Protection

The -16 to 80-V common-mode range of the INA200, INA201, and INA202 devices is ideal for withstanding automotive fault conditions ranging from 12-V battery reversal up to 80-V transients, since no additional protective components are needed up to those levels. In the event that the INA200, INA201, and INA202 devices are exposed to transients on the inputs in excess of their ratings, then external transient absorption with semiconductor transient absorbers (such as Zeners) will be necessary. Use of MOVs or VDRs is not recommended except when they are used in addition to a semiconductor transient absorber. Select the transient absorber such that it will never allow the INA200, INA201, and INA202 devices to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance, as well as additional voltage due to transient absorber dynamic impedance). Despite the use of internal Zener-type ESD protection, the INA200, INA201, and INA202 devices do not lend themselves to using external resistors in series with the inputs since the internal gain resistors can vary up to $\pm 30\%$. (If gain accuracy is not important, then resistors can be added in series with the INA200, INA201, and INA202 inputs with two equal resistors on each input.)

7.4.4 Output Voltage Range

The output of the INA200, INA201, and INA202 devices is accurate within the output voltage swing range set by the power supply pin, V_S . This performance is best illustrated when using the INA202 (a gain of 100 version), where a 100-mV full-scale input from the shunt resistor requires an output voltage swing of 10 V, and a power-supply voltage sufficient to achieve 10 V on the output.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The INA20x series is designed to enable easy configuration for detecting overcurrent conditions and current monitoring in an application. This device is individually targeted towards overcurrent detection of a single threshold. However, this device can also be paired with additional devices and circuitry to create more complex monitoring functional blocks.

8.2 Typical Application

NOTE: In this case, Q_1 is used to invert the comparator output.

Figure 33. Low-Side Switch Overcurrent Shutdown

8.2.1 Design Requirements

The device measures current through a resistive shunt with current flowing in one direction, thus enabling detection of an overcurrent event only when the differential input voltage exceeds the threshold limit. When the current reaches the set limit of the divider R_1/R_2 , the output of CMP_{OUT} will transition high which will turn Q_1 on and pull the gate of the Pass-FET low and turn off the flow of current.

Typical Application (continued)

8.2.2 Detailed Design Procedure

Figure 33 shows the basic connections of the device. The input terminals, IN+ and IN –, should be connected as closely as possible to the current-sensing resistor to minimize any resistance in series with the shunt resistance. Additional resistance between the current-sensing resistor and input terminals can result in errors in the measurement. When input current flows through this external input resistance, the voltage developed across the shunt resistor can differ from the voltage reaching the input terminals.

Use the Gain of the INA20x and shunt value to calculate the OUT voltage for the desired trip current. Configure R1 and R2 so that the current trip point is equal the 0.6-V reference voltage.

8.2.3 Application Curve

Figure 34. Low-Side Switch Overcurrent Shutdown Response

9 Power Supply Recommendations

The input circuitry of the INA200, INA201, and INA202 devices can accurately measure beyond the power-supply voltage, V_s . For example, the V_s power supply can be 5 V, whereas the load power-supply voltage is up to 80 V. The output voltage range of the OUT pin, however, is limited by the voltages on the power-supply pin.

10 Layout

10.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- The power-supply bypass capacitor must be placed as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

10.2 Layout Example

Figure 35. INA20x Layout Example

11 Device and Documentation Support

11.1 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
