

MAX149X2 Evaluation Kit

Evaluates: MAX14940/MAX14943/
MAX14946/MAX14949

General Description

The MAX149X2 evaluation kit (EV kit) is a fully assembled and tested PCB that demonstrates the functionality of the MAX14943 isolated RS-485/PROFIBUS transceiver. The EV kit operates from a single 3.3V supply and features an on-board isolated power supply to power the secondary-side of the circuit.

The MAX149X2 EV kit comes with the MAX14943GWE+ installed, but can also be used to evaluate the pin-compatible MAX14940, MAX14946, and MAX14949 ICs.

Features

- Operates from a Single 3.3V Supply
- Terminal Block Connectors for Easy RS-485/PROFIBUS Evaluation
- 5000V_{RMS} Isolation for 60s
- Fully Assembled and Tested
- Proven PCB Layout

Ordering Information appears at end of data sheet.

Quick Start

Required Equipment

- MAX149X2 EV kit
- 3.3V, 1A DC power supply
- Signal/function generator
- Oscilloscope

Startup Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- 1) Set the DC power supply to 3.3V and connect the DC power supply between the EV kits VDDA and GNDA connectors of the EV kit.
- 2) Ensure that J2 and J3 are in their default positions (see [Table 1](#)).
- 3) Turn on the power supply.
- 4) Set the signal/function generator to output a 100kHz 0 to 3V square wave. Note: Set the signal/function generator to operate with a high-impedance load. If needed, the R1 pad is available to add a 50Ω impedance to ground.
- 5) Connect the signal/function generator to the TXD test point.
- 6) Verify that the A and B outputs switch as the signal toggles.

Table 1. Jumper Settings (J1–J6)

JUMPER	SHUNT POSITION	DESCRIPTION
J1	1-2	Receiver is disabled. RXD is high impedance.
	2-3*	Receiver is enabled. RXD is active.
J2	1-2*	Driver is enabled. DEM is high.
	2-3	Driver is disabled. DEM is low.
J3	Open*	DE and \overline{RE} are not connected together.
	Closed	DE and \overline{RE} are connected together.
J4	Open*	A and B are not connected through the on-board 120Ω resistor.
	Closed	Connects the on-board 120Ω resistor between A and B.

*Default position.

Detailed Description of Hardware

The MAX149X2 EV kit is a fully assembled and tested circuit board for evaluating the MAX14943 isolated RS-485/Profibus transceiver (U1). The EV kit has been designed to allow for evaluating the IC alone or in a standard RS-485 configuration. The EV kit is powered from a single 3.3V power supply.

External Power Supply

The power on the EV kit is derived from a single 3.3V source. Connect an external supply from GNDA to either the VDDA test point or P1 connector to supply the 3.3V to the logic side (A) of the circuit. The integrated push-pull transformer driver and external transformer (TX1) generate an isolated supply for powering the (B) isolated side of the board.

Evaluating the Isolated RS-485 Interface

Driver and Receiver Enable Selection

The EV kit features three jumpers (J1, J2, and J3) to enable/disable the driver and receiver outputs. Set J1 to 2-3 to enable the receiver. Set J2 to 1-2 to enable the driver. To actively control both enables, remove J1 and J2 and close J3, which connects DE and RE together.

Resistors R2 – R4 Configuration

For end-of-the-line transceivers, close J4 to connect a 120Ω resistor (R3) between the A and B RS-485 I/Os on the IC.

Pullup and pulldown resistors are generally used on the receiver inputs to guarantee a known state in the event that all nodes on the bus are in receive mode, or the cable becomes disconnected. The exact value for these resistors varies with the application. Pads are provided for pullup (R2) and pulldown (R4) resistors for the A-B lines, although the use of these resistors is purely optional. Note that the MAX14943 features true fail-safe receiver inputs that ensure RXD is high when the receiver inputs are shorted, open, or connected to an idle bus.

Selecting a Transformer

[Table 2](#) is a list of transformers designed to operate with the device family. Select the transformer that best meets the performance requirements of the end application. All transformers in [Table 2](#) can be used on the EV kit.

Table 2. Transformer Selection

MANUFACTURER/PART NUMBER	TURNS RATIO	ISOLATION VOLTAGE (V _{RMS})	A-SIDE SUPPLY (V)	CAN BE USED WITH MAXIM PART NUMBERS
